## **SECTION 1 SPECIFICATIONS**

#### **GENERAL**

Number of semiconductors : Transistors 77 FETs 14

FETs 14 ICs (Including CPU) 43 Diodes 180

Frequency coverage : Ham band 1.8 MHz  $\sim$  2.0 MHz

3.5 MHz ~ 4.1 MHz 6.9 MHz ~ 7.5 MHz 9.9 MHz ~ 10.5 MHz 13.9 MHz ~ 14.5 MHz 17.9 MHz ~ 18.5 MHz 20.9 MHz ~ 21.5 MHz 24.5 MHz ~ 25.1 MHz 28.0 MHz ~ 30.0 MHz

General coverage 0.1 MHz ~ 30.0 MHz

(German version: 0.2 MHz ~ 26.1 MHz)

Thirty 1-MHz segments

Frequency control : CPU based 10-Hz-step digital PLL synthesizer with dual VFO

system

Frequency readout : 6-digit 100-Hz readout.

Frequency stability : Less than 250 Hz after switch-on 1 min. to 60 mins., and less

than 50 Hz after 1 hour. Less than 500 Hz in the range of -10°C

to 60°C.

Power supply requirements : 117V or 235V  $\pm 10\%$  50  $\sim$  60 Hz 30 VA

(100V/200V/220V use requires internal modification.)

Antenna impedance : 50 ohms, unbalanced

(Single wire can be used on 0.1 ~ 1.6 MHz)

Weight : 7.4 kg (10.3 lbs.)

Dimensions : 111 (H)  $\times$  286 (W)  $\times$  276 (D) mm

 $(4-3/8 \times 11-1/4 \times 10-7/8 \text{ inches})$ 

#### **RECEIVER**

Receiving system : Quadruple conversion superheterodyne with continuous band-

width control

(F<sub>3</sub>\*: Triple conversion superheterodyne)

Receiving modes

: A<sub>1</sub>, A<sub>3</sub>J (USB, LSB), F<sub>1</sub> (output FSK audio signal), A<sub>3</sub>, F<sub>3</sub>

IF frequencies

70.4515 MHz 1st

2nd

9.0115 MHz

3rd

455 kHz

9.0115 MHz (except F<sub>3</sub>\*)

4th with continuous bandwidth control (except F<sub>3</sub>\*)

2nd IF center frequency

: SSB (A<sub>3</sub>J)

9.0115 MHz

CW (A<sub>1</sub>) RTTY (F<sub>1</sub>) 9.0106 MHz

AM (A<sub>3</sub>) FM\* (F<sub>3</sub>) 9.0100 MHz

Sensitivity (when preamplifier

is ON):

: SSB, CW, RTTY

Less than 0.15 microvolts (0.1 ~ 1.6 MHz: 1 microvolt) for 10

dB S+N/N

AM Less than 0.5 microvolts (0.1 ~ 1.6 MHz: 3 microvolts)

FM\* Less than 0.3 microvolts for 12 dB SINAD (1.6  $\sim$  30 MHz)

Selectivity

: SSB, CW, RTTY 2.3 kHz at -6 dB

(adjustable to 500 Hz min.)

4.2 kHz at -60 dB

CW-N, RTTY-N

500 Hz at −6 dB

1.5 kHz at -60 dB

ΑM

6 kHz at -6 dB

(adjustable to 2.7 kHz min.)

18 kHz at -60 dB

FM\*

15 kHz at -6 dB

25 kHz at -60 dB

Spurious response rejection ratio

More than 60 dB

**Audio output** Audio output impedance

More than 2 watts 8 ohms

\* When optional FM unit is installed.

Specifications are approximate and are subject to change without notice or obligation.

## **SECTION 2 CONTROLS AND THEIR FUNCTIONS**

#### 2-1 FRONT PANEL

#### 1. MONITOR CONTROL

When using this set together with a transmitter or transceiver, actual transmitted signals can be monitored.

This control switches the monitor circuit ON and OFF, and controls its audio level. Use headphones or reduce monitor audio volume to prevent feedback to the transmitter microphone.

#### 2. NB (NOISE BLANKER) SWITCH

When pulse-type noise such as automobile ignition noise is present, press this switch in. The noise will be reduced to provide comfortable reception.

#### 3. NB TIMING SWITCH

The noise blanker blanking time can be selected (NORMAL and WIDE) by this switch. It will be effective against any type of noise.

#### 4. AGC TIMING SWITCH

For changing the time-constant of the AGC

(Automatic Gain Control) circuit. By setting the switch to the SLOW position, the AGC voltage is released more slowly. Set the switch to provide comfortable reception.

When the switch is in the OFF position, the AGC function is switched OFF and the S-meter does not move even if a signal has being received. (The AGC does not actuate in the FM mode.)

## 5. MODE-SELECT SWITCHES

Select any one of five operating modes by simply pressing the desired switch. Additionally, the CW and SSB switches have dual functions, as follows.

1. CW: For normal CW operation.

CW-N: By pressing the FUNCTION key first and then the CW button, the

narrow CW filter is selected.

SSB-N: For normal SSB operation, upper

sideband (USB) for the 10-MHz band and above, and lower side-

band (LSB) for the 9-MHz band and below.

SSB-R: For reverse SSB operation, lower sideband (LSB) for the 10-MHz band and above, and upper sideband (USB) for the 9-MHz band and below.

#### 6. POWER SWITCH

This switch is a push-lock type switch which controls the AC power to the unit. When the switch is pressed in and locked, power is supplied to the unit. When the switch is pressed again and released, power to all circuits is cut. (If the MEMORY switch on the rear panel is switched ON, power will be continuously supplied to the CPU to memorize the operating frequency, mode, etc.)

#### 7. FUNCTION KEY

Increase the function of the CW and SSB MODE SELECT and the VFO EQUALIZATION switch by pressing this key switch first.

#### 8. PREAMP/ATT (Attenuator) SWITCH

Switches the RF preamplifier and attenuator in the RF circuit.

When the switch is at the OFF position, both preamplifier and attenuator are removed from the cercuit, and incoming signals will be fed to the receiver directly.

When using a small antenna or receiving a weak signal, set the switch to the "PRE" position to put the preamplifier in the RF circuit and provide higher sensitivity.

When nearby signals interfere with reception, or when receiving a very strong signal, set this switch to the "ATT" position. This removes the preamplifier from the circuit and inserts the attenuator into the circuit. This gives about 20dB attenuation.

For normal operation leave this switch at the "OFF" position.

## 9. VFO EQUALIZATION SWITCH

When "A" VFO and "B" VFO are different frequencies, by pressing this switch, "B" VFO will have the same frequency as "A" VFO. This switch has dual functions: by pressing the FUNCTION key first and then this switch, "A" VFO will have the same frequency as "B" VFO.

#### 10. VFO SWITCH

You can select either of the two built-in VFOs ("A" VFO or "B") VFO with this switch.

In addition, when the VFO is switched from "A" VFO to "B" VFO, the frequency indicated on the frequency display just prior to switching goes into the memory inside the CPU. Thus, even if "B" VFO is being used, switching to "A" again will enable you to operate at the initial frequency. Switching from "B" to "A" results in the same operation.

#### 11. DIMMER SWITCH

By pressing this switch in, the intensity of the meter illumination and frequency display is reduced. Use this in the dark to prevent glare.

## 12. HAM BAND/GENERAL COVERAGE SELECT SWITCH

Selects the function of the set. In the HAM (out) position, the receiver functions in any of nine HAM bands between 1.8 MHz and 28 MHz. In the GENERAL COVER (in) position, the set functions as a general coverage receiver between 0.1 MHz and 30 MHz.

#### 13. BAND UP/DOWN SWITCHES

Change the operating band upward or downward. During HAM BAND operation, the band skips to the next upper or lower band with each push. (The 28-MHz band is divided into two segments, 28 ~ 29 MHz and 29 ~ 30 MHz.) During GENERAL COVERAGE operation, the band changes to the next upper or lower 1-MHz segment. When the band reaches the highest band, the next is the lowest band, and when the band reaches the lowest band, the next is the highest band.

#### 14. TUNING CONTROL KNOB

Rotating the TUNING CONTROL KNOB clockwise increases the frequency, while rotating it counterclockwise decreases the frequency. The frequency is changed in 10-Hz, 100-Hz or 1-kHz steps, according to the TUNING RATE switches. One complete rotation of the tuning knob results in a 1-kHz frequency increase or decrease in 10-Hz steps, 10 kHz in 100-Hz steps and 100 kHz in 1-kHz steps.

## 15. TUNING RATE SWITCHES

The small vernier marks on the tuning knob are changed to correspond to 10-Hz, 100-Hz or 1-kHz steps selected by pressing the 10 Hz, 100 Hz or 1 kHz switch.

#### 16. DIAL LOCK SWITCH

After the IC-R70 is set to a certain frequency by pressing the DIAL LOCK switch, the VFO is electronically locked to the displayed frequency, thus inactivating the operation of the tuning knob. To change frequency, the dial lock must first be disengaged by pressing and releasing the DIAL LOCK switch again.

#### 17. RIT CONTROL

Shifts the receiving frequency ±800 Hz to either side of the displayed frequency. When the RIT is ON, the RIT INDICATOR is illuminated. Rotating the control to the (+) side increases the receiving frequency, and rotating to the (-) side decreases the receive frequency. With the RIT ON, if the TUNING CONTROL KNOB is moved one increment, the RIT circuit is automatically pulsed OFF. Therefore it is

unnecessary to manually switch OFF the RIT when changing the operation frequency. The frequency shift by turning the RIT Control is not indicated on the frequency display.

#### 18. RIT SWITCH

Press once for ON; for OFF, press the switch again.

When the RIT is ON, the RIT INDICATOR will illuminate. (Note: The RIT will also pulse OFF when the TUNING CONTROL knob is turned.)

#### 19. NOTCH FILTER SWITCH

Switches the notch filter function ON and OFF.

#### 20. NOTCH FILTER CONTROL

Shifts the notch filter frequency. Adjust the control so that the interference is reduced.

#### 21. P.B. TUNE (PASS BAND TUNING) CONTROL

Allows continuous tuning of the pass-band selectivity by moving the filter up to 500Hz from the upper to lower side in SSB, CW and RTTY, and 2.7 kHz in AM. Not only improves selectivity, but also can improve the audio tone. Normal position is the center (12 o'clock) or OFF position and is 2.3-kHz wide in SSB, and 6-kHz wide in AM.

#### 22. PHONES JACK

Accepts a standard 1/4 inch headphones plug for headphones of 4  $\sim$  16 ohms. Stereo phones can be used without modification.

#### 23. RECORDER JACK

Accepts a 3.5 mm mini plug for a tape recorder to record receiving signals. The output is a fixed level regardless of the position of the AF GAIN control.

#### 24. AF GAIN CONTROL

Controls the audio output level. Clockwise rotation increases the level.

## 25. RF GAIN CONTROL

Controls the gain of the RF section. Clockwise rotation gives the maximum gain. As the control is rotated counterclockwise, the needle of the METER rises, and only signals stronger than the level indicated by the needle will be heard.

#### 26. SQUELCH CONTROL

Sets the squelch threshold level. To switch OFF the squelch function, rotate this control completely counterclockwise. To set the threshold level higher, rotate the control clockwise.

#### 27. TONE CONTROL

Controls the receiver audio tone. Adjust the control to provide comfortable reception.

#### 28. S-METER

Signal strength of an incoming signal is indicated on a scale of S1  $\sim$  S9 and S9 to S9 + 40 dB, and a linear scale divided into five.

#### 29. MUTE INDICATOR

Illuminates when the receiver is in the mute mode for an external transmitter or transceiver.

#### 30. SIGNAL INDICATOR

Illuminates when the squelch is opened.

#### 31. FM TUNING INDICATOR

Illuminates when the set is tuned to an incoming signal frequency within 1 kHz (when optional FM unit is installed).

#### 32. RIT INDICATOR

Illuminates when RIT is switched ON.

#### 33. MODE/FREQUENCY DISPLAY

The frequency of the IC-R70 is displayed on a luminescent display tube. Because the 1-MHz and 1-kHz decimal points are displayed, the frequency can easily be read. The frequencies indicated are the carrier frequencies of each mode in AM, USB, LSB and CW. In the RTTY mode, the mark frequency (2125 Hz beat tone) is displayed.

## 2-2 UNDER THE ACCESS COVER

## 34. MONITOR GAIN SWITCH

Switches the gain of the receiver (monitor) in the mute mode, High and Low. Set the switch for comfortable monitoring.

#### 35. RTTY FILTER SWITCH

Switches the crystal filters, 500 Hz/-6 dB (for CW) and 2.3 kHz/-6 dB (for SSB) in the RTTY mode. The selected filter is provided for RTTY reception when RTTY mode-select switch on the front panel is pushed.

#### 36. FREQUENCY SET CONTROL

This control is for fine adjustment of the reference frequency of the PLL unit, which is the local oscillator frequency. Do not turn it unless you want to change the frequency.

## 2-3 REAR PANEL

#### 37. MUTE TERMINAL

When you wish to use the unit together with a transmitter or transceiver, ground this terminal in the transmit mode; the unit is muted and monitors the transmitted signals.

#### 38. EXTERNAL SPEAKER JACK

When an external speaker is used, connect it to this jack. Use a speaker with an impedance of 8 ohms. When the external speaker is connected, the built-in speaker does not function.

## 39. ACCESSORY (ACC) SOCKET

Various functions are available through the accessory socket, such as frequency control, receiver output, T/R changeover, etc. The table below shows those terminals.

FUNCTION
8 volts DC is available when the squelch is closed.
13.8 volts DC in conjunction with the power switch operation
When this terminal is grounded, the unit becomes the mute mode.
Output from the receiver detector stage. Fixed output regardless of AF output or AF gain.
NC (no connection)
8 volts DC is available when pin 3 is grounded. (Relay cannot be directly actuated. Max. 5 mA)
NC
Ground
NC
Input for TRVA converter control signal
Input for TRVB converter control signal
Output reference voltage for band switching
INPUT/OUTPUT for external band switching
NC
NC

PIN NO.	FUNCTION
16.	Input for external control (DBC signal)
17.	NC
18.	Input for external control (RC signal)
19.	Output for external control (DV signal)
20.	Input for external control (RT signal)
21.	Input/output for external control (DB1)
22.	Input/output for external control (DB2)
23.	Input/output for external control (DB4)
24.	Input/output for external control (DB8)

## **ACC SOCKET CONNECTIONS**

4 8 12 16 29 29	
000000 0000000 00000000 00000000	
(0,0000000)	Outside view

#### **40. AC POWER SOCKET**

For connection of the supplied AC power cable.

## 41. FUSE HOLDER

This holds a fuse for the AC power circuit. If the fuse is blown, replace it with a new 1A fuse for 100/117V operation, or 0.5A fuse for 200/220/235V operation, after checking the cause. Open the fuse holder with a philips head (+) screwdriver.

#### 42. MEMORY SWITCH

When this switch is at the ON (up) position, the power to the CPU of the set is supplied continuously, even when the POWER SWITCH on the front panel is switched OFF, in order to retain all the operating frequencies of the two VFO's, etc. When this switch is set to the OFF position, all the power, including that to the CPU, is switched OFF by switching OFF the POWER SWITCH, so that all operating frequencies of the two VFOs, etc. are erased.

#### 43. LOW BAND ANTENNA SWITCH

Switches the low band (1600-kHz and below) antenna terminals; ANT 1 ( LOW BAND ANTENNA TERMINAL) for a high-impedance antenna such as a long-wire antenna, and ANT 2 ( 50-ohm ANTENNA CONNECTOR) for a 50-ohm coaxial cable.

#### 44. SCOPE TERMINAL

This terminal brings out the 70.4515-MHz IF signal from the mixer in the receiver. Not only observes the received signal, but also those signals of a selected band width by using a panadaptor or panascope.

#### 45. CONVERTER INPUT TERMINAL

VHF and UHF operation (by using a suitable converter with the IC-R70) is possible. This terminal is for converter connection.

#### 46. LOW BAND ANTENNA TERMINAL (ANT 1)

For connection of a low band antenna to receive 1600 kHz and below. When the operating frequency goes to 1600 kHz and below, the antenna terminal will be changed from the (47) ANTENNA connector to this terminal automatically (when the (43) LOW BAND ANTENNA SWITCH is set at the ANT 1 position).

## 47. ANTENNA CONNECTOR (ANT 2)

This is used to connect the antenna to the unit. Its impedance is 50 ohms, and it connects with a PL-259 connector.

#### 48. GROUND TERMINAL

To prevent electrical shock and other problems, be sure to ground the equipment through the GROUND TERMINAL. For best results, use as heavy a gauge wire or strap as possible and make the connection as short as possible.

## **SECTION 3 INSIDE VIEWS**

## 3-1 TOP VIEW

## **3-2 RF UNIT**

## 3-3 BOTTOM VIEW

## 3-4 PLL UNIT

## **SECTION 4 BLOCK DIAGRAM**

## **SECTION 5 CIRCUIT DESCRIPTION**

## 5-1 RF UNIT

## 1. RF stage

The signal (1.6  $\sim$  30 MHz) received from the antenna connector (ANT2) is fed to the input selecting circuit.

Usually, the TRH signal from the logic unit is "L" level, so Q1 is turned ON, D3 is turned ON, current flows to R7, and the signal from the antenna connector signal is fed to the BPF (band-pass filter).

Note that current flows from Q1 to R3, D1 and R8; D1 is turned ON; and the input signal from the converter terminal is shunted to ground through C2.

If the converter terminal is used, Q1 is turned OFF because the TRH signal from the logic unit is "H" level; D5 is turned ON, D2 is also turned ON, current flows to R7, and the signal from the converter terminal is fed to the BPF.

The TRH signal also flows to R5, D4 and R2; and the input signal from the antenna connector is shunted to ground through C4.

Good isolation is provided between the antenna connector and the converter terminal by this circuit.

The signal received from the input-selecting circuit is fed to the BPF, where unwanted signals outside of each band width are removed.

BPF switching signals from the logic unit are supplied to J5, the BPF input/output switching diodes (D8  $\sim$  D25) are turned ON according to each band, and the BPF corresponding to the band is selected, causing the received signal to pass.

The received signal which has passed through the BPF is fed to the PREAMP/ATT switching circuit. These can be selected by a switch on the front panel.

When the OFF position is selected, only Q7 is turned ON, and voltage is supplied to the through circuit. When PREAMP is selected, the 13.8V from the PRE/ATT switch is divided at R57 and R58, is applied to the Q3 base, Q3 is turned ON, and the preamplifier circuit which employs push-pull of junction-type FETs Q5 and Q6 operates.

One part of this voltage is passed through D34 and R55, is applied to the Q4 base, turning it ON; the Q7 base is grounded, turning it OFF; and only the preamplifier circuit operates.

When ATT is selected, the 13.8V from the PRE/ATT switch is directly applied to the ATT circuit, D35, R55 and Q4 in that order, and only the attenuation circuit is switched ON. An attenuation of approximately 20 dB is obtained by R36  $\sim$  R38.

When the receiving frequency is 100 kHz  $\sim$  1.6 MHz, even if the PRE/ATT switch is at the "pre-amp" position, a part of the BPF switching voltage from the logic unit passes through R59, is applied to the Q2 base, Q2 is turned ON, and Q3 OFF. Note that there is operation, regardless of the receiving frequency, when the setting is the "through" or "attenuation" position.

When this unit is monitoring the transmission of some other unit with which it is transceiving, when T8V is applied it passes through D36, D35, R55 and R30 (regardless of the position of the PRE/ATT switch), and the attenuator circuit only is forced to operate so that Q2 and Q4 are not turned ON.

## 2. 1st IF stage

The signal through the preamplifier, attenuator or directly, and the 1st LO (70.4515  $\sim$  100.4515 MHz) from the PLL unit, buffer-amplified at Q10, are fed to the 1st mixer to convert into 70.4515 MHz 1st IF signals.

The signal converted to the 70.4515-MHz 1st IF by the DBM (double-balanced mixer) is amplified at Q8 after passing through the FI1 ( $\pm$ 7.5 kHz/3 dB) monolithic crystal filter. AGC is applied to the 2nd gate. The amplified signal is supplied to the main unit via J4.

In this amplification circuit, during transmission monitoring, the muting voltage from the main unit passes through R54 and D33, is applied to Q8, and its gain is changed. Gain can be adjusted by S1 on the main unit.

#### 5-2 MAIN UNIT

## 1. 2nd ~ 4th IF stages

The 1st IF signal (70-MHz band) input from P1 passes through the T-type attenuator (R1  $\sim$  R3), is mixed with the 2nd LO (61.44 MHz) signal by the DBM (D1  $\sim$  D4), and is converted to the 2nd IF (9.0115 MHz) signal.

The signal converted to the 2nd IF passes through the NB gate (D5  $\sim$  D8), and, after amplification by Q2, passes through the filters (FI1  $\sim$  FI3) corresponding to the receiving mode and is amplified at Q7.

The IF signal amplified at Q7 is mixed by Q8 with the 3rd LO (9.4665 MHz  $\pm$  PBT change amount) oscillated by Q9 and X1, and is converted to the 3rd IF (455 kHz  $\pm$  PBT change amount).

The 3rd IF signal performs PBT (pass-band tuning) by the duplication of the 455-kHz filters (FI4 and FI5) and the 9-MHz filters (FI1  $\sim$  FI3) being varied by the 3rd LO.

Signals to the optional FM unit are taken out through J8 as wide-band signals prior to the 455-kHz filters. The SSB, CW, RTTY or AM signal which has passed through the 455-kHz filter is, after tuning by L14, fed to the DBM IC2. It is mixed with the 3rd LO (9.4665 MHz  $\pm$  PBT change amount) signal, the same one to Q8, and becomes the 4th IF (9.0115 MHz  $\pm$  PBT change amount) signal.

After tuning to 9 MHz by L15, it is fed to the notch filter (composed of L16, L17, D34 and X2).

By using a crystal, this filter is able to obtain deep attenuation without damaging the IF characteristics. A bias voltage is applied to D34, and this voltage is controlled by the NOTCH FILTER control on the front panel, and the frequency is varied.

The range of variation is  $\pm 1.3$  kHz.

The spurious component generated during mixing at IC2 is removed by FI6 from the signals which have passed through the notch filter, and, after amplification at Q15 and Q16, the signals are divided into 3 and supplied to the detector corresponding to each mode.

One is fed to the AM-detection circuit through C92, another is fed to the SSB and CW detection circuit through C91; and the other is fed to the AGC detection circuit.

#### 2. AF stage

The SSB, CW or RTTY signal fed to IC3 by C91 is product-detected with the BFO signal.

The AM signal is input by C92 to D74 and detected.

Except for the AM mode, Q19 performs switching to stop the AM detection by D74. During the AM mode, the BFO oscillation stops and there is no output from IC3.

Each of the detection outputs, including AM and FM (when the optional FM unit is installed), is fed to the same line, and squelch is applied by Q32.

IC5 is an IC for the electronic attenuation element; the pin 1 input side is for receiver and the pin 8 input side is for transmission monitoring. The various operations are selected by Q34 and Q35. Tone control is also accomplished by using the terminal (pin 2) for frequency compensation.

A part of each detection output is taken out through C156, and, after amplification at Q36, AF OUT signals to ACC and the REC terminal on the front panel are obtained.

Squelch is also applied by Q37 to these two types of AF output.

IC5 output is amplified at IC6 and is fed to the speaker.

#### 3. Other circuits

#### (a) Noise-blanker circuit

The signal converted to the 2nd IF at the 2nd mixer passes through C3, is amplified at FET Q1 (in the first noise-amplifier stage), and is amplified to a sufficient level by the high-gain IC, IC1.

After the noise signal tuned at L8 is subjected to voltage-doubling rectification at C10, D9 and D10, it is divided in 2, one part of which passes through R17 and is fed to the Q4  $\sim$  Q6 AGC circuit.

The AGC in this stage is obtained by increasing the voltage applied to pin 3 of IC1. This provides a wide dynamic range.

For woodpecker noise, etc., the AGC voltage rise time-constant is switched by the NB N/W select switch on the front panel, thus providing excellent blanking.

Noise signals rectified at D9 and D10 are applied to the Q3 base and are current-amplified; bias current from R7 to D5  $\sim$  D8 is bypassed at R8. As a result, D5  $\sim$  D8 are turned off and the received signal is not fed to the following circuit.

## (b) Filter-select circuit

This circuit selects the appropriate filter for the operating mode by turning input/output switching diodes of D39  $\sim$  D46, with mode signals input from J10.

At this time, RTTY is caused, by S2 in the main unit, to pass through FI1 (500 Hz/6 dB) during narrow shift or FI2 (2.2 kHz/6 dB) during wide shift. During the FM mode, it does not pass through a filter, but passes through a by-pass circuit consisting of D19 and D20.

FI3 is 6 kHz/6 dB, and is for the AM mode.

#### (c) AGC circuit

Signals output from the secondary side of L24 are amplified at Q18 after detection at D73, and then an AGC voltage is obtained from the collector.

When there are no signals, the AGC voltage is offset, through D72, to the voltage (approx. 4V) set by R125 and R123.

When there are signals, Q18 is ON, collector voltage (i.e., AGC voltage) is decreased, the 2nd gate voltage of each FET connected to the AGC line is also decreased, and the gain of each amplifier stage falls.

For the time-constants of AGC, the attack time is set by R106 and C160, and the release time is set by R103, R105, C77 and C79.

In order to provide full break-in during transmission, AGC voltage is held by the switching circuit consisting of Q22 and Q24.

When the AGC switch is set at FAST, the AGC voltage passes through R109 switched by Q20 and is quickly discharged.

## (d) BFO circuit

Mode signals from J10 pass through the respective diode (one of D61  $\sim$  D65) for each mode, and switch 2 crystals and shunt coils in series with a crystal, and the proper BFO frequency for each mode is obtained.

Q13 is a crystal oscillator and Q14 is a buffer-amplifier.

#### (e) S-meter circuit and squelch circuit

AGC voltage is fed to IC4B, inverting the amplifier, giving a wide dynamic range and high linearity, and causing the S-meter to move.

Part of S-meter voltage is fed to IC4A, comparator, and this circuit provides a stable squelch function for modes other than FM.

Q32 and Q31 are a circuit to produce squelch (SQL S) voltage; the signal LED is illuminated by Q30.

#### (f) Other circuits

IC7 is a voltage regulator supplying 8V to each part.

D52 and Q27  $\sim$  Q29 are provided for use with a transmitter; the T8 signal which controls receiver operation is obtained by the signal from the SEND terminal.

## 5-3 PLL UNIT

This unit is composed of the 1st LO circuit for the 1st mixer, and the 2nd LO circuit for the 2nd mixer. The 1st LO circuit covers  $70.4515 \sim 100.4515$  MHz with three phase-locked loops, and the local oscillator of the 2nd loop provides 10-Hz steps with the DA signals from the logic unit. The 2nd LO circuit provides a 61.44-MHz signal by multiplying the reference frequency (20.48 MHz).

## 1. Reference oscillation circuit and 2nd LO circuit

The output (20.48 MHz) obtained at the oscillation circuit (composed of X1 and Q12) is used as the 2nd LO and the Local Oscillator and reference frequency for the 3rd loop.

The oscillation output of Q12 is tripled at Q13, and 61.44-MHz 2nd LO output is obtained.

The oscillation output of Q12 also is fed to the Q11 buffer-amplifier and is supplied to IC6. Here there is a 2-stage 1/2-frequency divider, and the 10.24 MHz obtained at the first stage is output from pin 9 as LO for the 3rd loop; the 5.12 MHz obtained at the next stage is output from pin 5 as the reference frequency of the 1st loop and the 2nd loop.

#### 2. 3rd loop

This loop is a mixed-down type PLL composed of IC3, IC4, Q1, etc.

IC4 has a built-in oscillator circuit, DBM and amplifier circuit.

The built-in oscillator circuit of IC4 is employed as the VCO, and one part of that output is fed to the DBM in the next stage.

The 10.24 MHz from IC6 is injected to pin 4, and mixed with the VCO output. The mixed-down signal is output from pin 6. This output passes through the low-pass filter composed of L16 and C81  $\sim$  C83, and is then again fed to pin 7 to IC4. Then, after amplification by the amplifier circuit built into IC4, the signal is output from pin 9 and then fed to pin 12 of IC3.

The 13.15  $\sim$  23.14-MHz signal from pin 3 is fed to IC5, becoming the reference frequency of the 2nd loop.

IC3 is a multi-function IC which has a built-in programmable divider, fixed frequency divider, phase comparator, etc.

After signal input to pin 12 is 1/N frequency divided by N data from the logic unit, it is fed to the phase comparator.

The 5.12 MHz signal fed to pin 20 from IC6 is divided to 1/512, and the 10-kHz reference frequency is fed to the phase comparator.

The phase-difference pulses resulting from the two input signals are output from pin 16, and, after conversion to a DC voltage by the Q1 loop filter, are provided as the control voltage for D3 (varactor diode).

After the 5.12 MHz from IC6 is amplified, it is supplied from pin 21 to the 1st loop as the reference frequency.

## 3. 2nd loop

This loop is a mixed-down type PLL loop composed of IC7, IC8, Q10 and Q14.

X2 and Q14 are an oscillation circuit for VXO (Variable Crystal Oscillator) use; control is by the DA signal from the logic unit and provides 10-Hz steps; RIT and CAL (frequency calibration), etc. are controlled by D14.

Because IC8 is the same as IC4 used in the 3rd loop, it has the same block configuration. The VCO is composed of the oscillator circuit built into this IC. Its output and the Q14 VXO output (30.72 MHz) signal are mixed at the DBM, and the mixed-down signal is output from pin 6.

This output passes through the low-pass filter composed of L21 and C100  $\sim$  C102, and is then fed to pin 7 of IC8 again. Then, after amplification at the amplifier circuit in IC8, it is fed from pin 9 through Q10 to pin 3 of IC7.

IC7 is a phase comparator; the reference frequency (131.5  $\sim$  231.4 kHz) divided to 1/100 the 3rd loop output by IC5 is applied to pin 1.

Pulses produced by the phase-difference of the two signals injected to pin 3 and pin 1 are output from pin 5 and pin 10, pass through the loop filter composed of R57  $\sim$  R59 and C93, and are provided as control voltage for D13.

## 4. 1st loop

This loop is a mixer/prescaler type PLL composed of IC2, IC9, IC10, Q2 ~ Q5, D1 ~ D11, etc.

 $Q2 \sim Q5$  are VCOs which divide the entire band into four segments and obtain the 1st LO output; each VCO is switched by VCO SW data from the logic unit.

VCO output, after amplification at Q6 and Q8, is fed to IC10, and is mixed with the output frequency of the 2nd loop. The mixed signal is fed to pin 8 of IC9 through the BPF consisting of L24  $\sim$  L27 and C110  $\sim$  C119.

Here, after 1/10 frequency division, it is fed to pin 12 of IC2.

IC2 is the same type of IC as used for IC3 of the 3rd loop; the signal fed at pin 12 is frequency-divided to 1/N and fed to the internal phase comparator.

The 5.12 MHz input to pin 20 becomes the 10-kHz reference frequency at the internal 1/512 frequency divider, and is fed to the internal phase comparator.

The pulse produced by the phase difference of the two input signals is output from pin 16, and, after it is converted to a DC voltage by the loop filter consisting of R3 ~ R6, D1, D2, C22 and C24, it is provided to each varactor diode (D4, D6, D8 and D10) of the VCO as control voltage.

The VCO output is amplified at Q7, and then output from J3 as the 1st LO. Note that, although the reference frequency of the 1st loop is 10 kHz, the output from IC10 is frequency-divided to 1/10 at IC9; the result is a loop locked at 100 kHz.

For Q16 and Q17, when the frequency changes greatly, PLL output is stopped by the IC2 unlock-detection circuit for the period of the R83 and C163 time-constants.

Frequency (MHz)	PLL N	vco	Oscillation frequency (MHz)	MIX output (MHz)	Remarks

## **5-4 LOGIC UNIT**

This unit controls the frequency, processes the band signals and mode signals, outputs data to the PLL, etc, and is designed for low power consumption and high speed operation by using a CMOS 4-bit CPU.

#### 1. CPU

IC14 is the CPU, in a 42-pin plastic package.

Pin 1 and pin 42, CL<sub>1</sub> and CL<sub>0</sub>, are the clock terminals for this CPU, oscillating about 400 kHz with a ceralock (ceramic oscillation unit). This CPU has 9 input/output ports, each sharing its own function.

#### A port 4-bit input

As shown in the matrix table, decodes E port output to expand input functions with time sharing.

## B port 4-bit output

Used for band-pass filter switching.

#### D port 4-bit input/output

Used as input/output terminal for external remote-control.

## E port 4-bit output

Outputs various data as a general-purpose output terminal.

## F port 4-bit output

F<sub>0</sub> ... Strobe signal output for display.

F<sub>1</sub> ... Load signal output for PLL above 100 kHz digit.

F<sub>2</sub> ... Load signal output for PLL below 100 kHz digit.

F<sub>3</sub> ... Relay-drive output

## G port 4-bit output

PLL digit designating output

#### H port 4-bit output

PLL 10 Hz D/A converting output.

#### I port 2-bit output

lo ... Load signal for mode output

I2 ... DV output for remote-control unit

#### 2. Input matrix circuit

## ① $Q_0 \rightarrow A_0 \sim A_2$ (count 1 $\sim$ 3)

Signals from the encoder are input to the CPU through these counters. Data to be added to or subtracted from the preset frequency of the CPU can be expressed in the range of  $0 \sim 7$ .

Add/substract data	0	1	2	3	4	, 5	6	7
Count 1	0	1	0	1	0	1	0	1
Count 2	0	0	1	1	0	0	1	1
Count 3	0	0	0	0	1	1	1	1

#### ② $Q_0 \rightarrow A_3$ (UP or DOWN)

Determines whether to add to (UP) or subtract from (DOWN) the frequency depending on the direction of the encoder rotation.

UP for H-level (with input) and DOWN for L-level (without input).

## $\textcircled{3} \ Q_1 \rightarrow A_0 \ (A \ \Diamond \ B)$

By pressing the A \(\rho\) B switch, the frequency of the VFO A is transferred to the VFO B. The content of VFO A is retained.

When the FUNC switch is ON  $(Q_2 \rightarrow A_0)$ , the opposite function (B  $\Diamond$  A) will occur.

## 4 $Q_1 \rightarrow A_1 \sim A_2$ (BAND UP or DOWN)

Change-over of one amateur band to another where ham band operation is designated; UP/DOWN of every 1 MHz where general coverage operation is designated.

This operation takes place only when either  $Q_1 \rightarrow A_1$  or  $Q_1 \rightarrow A_2$  becomes H-level.

#### (5) $Q_1 \rightarrow A_3$ (POWER ON)

Becomes H-level when power ON, indicating normal operation. When OFF, becomes L-level if there is a back-up power supply; original data will remain the same.

## ⑥ $Q_2 \rightarrow A_0$ (FUNCTION)

When this line is H-level due to operation of the FUNC switch, the CW, SSB and A \(\rightarrow\) B switches perform their secondary function respectively. When any other switch has been depressed, this function is cleared and this line becomes L-level.

## $\bigcirc Q_2 \rightarrow A_1$ (REMOTE CONT. IN)

Becomes H-level when remote-control unit is connected; VFO A, VFO B and HAM/GENE switches on the set become inoperative.

#### (8) $Q_3 \rightarrow A_0$ (VFO A or B)

When this line is L-level, VFO A is selected.

When this line is H-level, VFO B is selected.

## 

Used as remote-control unit status.

#### 

Designates the SSB mode. USB is usually selected automatically on 10 MHz or a higher band, and LSB on 9 MHz or a lower band. However, when  $Q_2 \rightarrow A_0$  (FUNC) is H-level, USB and LSB are reversed at every input. This function is cleared when the BAND UP or DOWN signal is input.

#### $\bigcirc Q_4 \rightarrow A_1 (CW MODE)$

Designates the CW mode; becomes CW-N mode when  $Q_2 \rightarrow A_0$  (FUNC) is H-level.

## $\textcircled{1} Q_4 \rightarrow A_2 \text{ (RTTY MODE)}$

Designates the RTTY mode.

#### $\bigcirc Q_4 \rightarrow A_3 \text{ (AM MODE)}$

Designates the AM mode.

#### $\textcircled{1} \ Q_5 \rightarrow A_0 \sim A_1 \ (TRV \ A/B)$

When a transverter signal is input through pin 11 (TRV B) and pin 10 (TRV A) of the ACC socket, the set receives a converted signal from a VHF/UHF transverter or converter. When a transverter signal is input however, the result is general coverage, regardless of the setting of the HAM/GENE select switch.

TR	/ A		TRV B	Object frequency	Input/output frequency	Remarks
			L	Ordinany condition	0 ~ 30 MHz	10-MHz digit display
H	i		<b>L</b>	50 MHz	20 ~ 23 MHz	"2" is extinguished.
 ı		-	Н	144 MHz	24 ~ 25 MHz	
<u> </u>	<u> </u>		<b>H</b>	430 MHz	20 ~ 29 MHz	

## (§) $Q_5 \rightarrow A_2$ (HAM or GENE)

When input is L-level by the HAM/GENE select switch, the ham band mode is selected; when input is H-level, the general coverage mode is selected.

#### (6) $Q_6$ → $A_0$ ~ $A_1$ (10 Hz/100 Hz STEP)

Designates frequency resolution: 10-Hz step when  $Q_6 \to A_0$  is H-level, 100-Hz step when  $Q_6 \to A_1$  is H-level.

When the TS switch is switched ON, both become L-level, and 1-kHz step is selected.

#### 3. Sensor signal processing circuit

The two signals from the encoder are input to SENS A and SENS B; each is subjected to waveform shaping at the Schmitt trigger (consisting of two IC9 inverters); they are differentiated at C34, C35, R44 and R45, and are input to pin 8 and pin 9 of IC3.

The sensor outputs 50 pulses per revolution while pin 10 of IC3 outputs both leading edge and trailing edge, resulting in an output of 100 pulses per revolution.

IC13 is a 3-bit counter which can count up to a maximum of 7 pulses, and serves as a timing buffer between the encoder and the display in relation to reading by the CPU.

If there is any output at the IC13 counter, the IC12 (diode array) output becomes H-level, and it is input to pin 5 of IC3, inverted, and input to the INT terminal of IC14 at L-level.

This terminal is the interrupt terminal; it stops other operations and gives priority to sensor processing. When the interrupt routine is started, IC13 counter data and up/down data from IC8 (pin 13) are read out at IC11 switching gate by digit 0 timing, and all data relative to sensor are performed.

Immediately after sensor data is read, pulses are sent to the G1 and G3 output ports; after these pulses pass through pins  $11 \sim 13$  of IC10 and pin 9 and pin 8 of IC9, their width is further narrowed by C49 and R93, and IC13 and IC8-B are cleared, awaiting the next sensor input.

The IC8 flip-flops (pins 9  $\sim$  11 and 13) hold only the UP signals; DOWN signals are not input.

IC6 is the decoder for the matrix; it decodes signals from E output and distributes to digit 0 to 9 signals. The dial lock signal passes through J3 from the LOCK switch on the front panel, and locks by the reset line (CL) of IC8-B and IC13, becoming H-level.

## 4. Band signals

When the power switch of this unit is switched ON, the band-switching signal from port  $F_3$  is counted by the IC22 BCD UP counter and that 4-bit count output is read in as the band signal at the B port of the CPU.

This signal is compared with the original band signal within the CPU, and pulses are sent to the F<sub>3</sub> port until there is coincidence.

A part of this signal buffered at IC5 is fed to Q1 of the display unit, and the mode indication is extinguished until the band signal is acknowledged by the CPU.

The 4-bit count-output from IC22 passes through BA1 ~ BA4 of P5, and is supplied to the optional LDA unit.

Note that the band signals relative to each frequency are as follows.

Frequency (MHz)	Band signal (4 bit)	Bo	B <sub>1</sub>	B <sub>2</sub>	В3
0 ~ 1.999	1	1	0	0	0
2.0 ~ 3.999	2	0	1	0	0
4.0 ~ 7.999	3	1	1	0	0
8.0 ~ 10.999	8	0	. 0	0	1
11.0 ~ 14.999	4	0	0	1	0
15.0 ~ 21.999	5	1	- 0	1	0
22.0 ~ 29.999	6	0	1	1 .	0

#### 5. Band-pass filter and VCO switching signal

Band-pass filter switching signals corresponding to display output signals of the CPU are output from  $C_0 \sim C_3$  terminals. IC15 is the decoder for these 4-bit signals. These signals are multiplexed into signals,  $0 \sim 9$ , and output to the RF unit and PLL unit through buffers, IC20 and IC21, for use as band-pass filter switching and VCO switching signals.

The band-pass filter switching signal for each frequency is as follows:

Frequency	Signal (4-bit)		- C <sub>o</sub>	_		•
(MHz)	BPF	vco	- Co	C <sub>1</sub>	C₂	C₃
0 ~ 1.599	0		0	0	0	0
1.6 ~ 1.999	. 1		1	0	0	0
2.0 ~ 2.999	2	. Vo	0	1	0	0
3.0 ~ 4.999	3		1	1	0	0
5.0 ~ 7.999	4		0	0	1	0
8.0 ~ 10.999	5		1	0	1	0 -
11.0 ~ 14.999	6	V <sub>1</sub>	0	1	1	0
15.0 ~ 21.999	7	V <sub>2</sub>	1	. 1	1	0
22.0 ~ 27.999	8		0	0	0	1
28.0 ~ 29.999	9	. V₃	1	0	0	1

## 6. Mode signal circuit

Mode signals are output from the CPU's E port, and are latched at IC16 by the load signals from the  $I_0$  terminal. IC18 is the decoder for this operation, where the signal is decoded into each mode signal and output through buffers IC5 and IC21. Note that, because there is no program in the CPU, FM mode signals are produced by IC19, Q9, Q10, etc.

The mode signals also produce segment signals a  $\sim$  d to extinguish those segments unnecessary for display of the mode by the display unit.

The mode signals relative to each mode are as shown below.

Mode	Mode signal (4-bit)	E <sub>0</sub>	E <sub>1</sub>	E <sub>2</sub>	. E <sub>3</sub>
AM (FM)	0	0	0	0 .	0
CW-N	1	1	0.	0	0 -
LSB	2	0	1	. 0	. 0
USB	4	0	0	1	0
cw	8	0	0	0	1
RTTY	9	1	0	0	1

## 7. PLL data output circuit

The output data are separated into higher digits than 100 kHz and the lower digits, and fed to each programmable divider of the loop. There are three kinds of signal output to the PLL: numerical data, digit designation data and load enable signal.

Numerical data are output from the general purpose E port and are buffered by IC4.

IC4 also functions as a gate to feed these data to the PLL only at the moment the digit designation data are emitted from the G port of the CPU.

One of the digit designation data signals passes through IC7, OR gate, switches  $\Omega$ 2,  $\Omega$ 3 and the power voltage of IC4, and controls the gate function. Load signals emitted from  $F_2$  and  $F_1$  terminals are fed to the PLL through IC4, buffer/gate. IC5 is the buffer for the digit designation data from G port, and feeds them to the PLL.

The 10-Hz digit data are output from the H port, and, after conversion to an analog value (DC voltage) at the D/A converter, R53  $\sim$  R56, pass through J2 and are supplied to the PLL unit.

High N-DATA × 10MHz, × 1MHz, × 100KHz			Low N-DATA × 10KHz, × 1KHz, × 100Hz		
Frequency	CPU-N	PLL-N	Frequency	CPU-N	PLL-N
0MHz	289	396	0Hz	184	291
0.1MHz	290	397	100Hz	185	292
1MHz	299	406	200Hz	186	293
10MHz	389	496	1KHz	194	301
20MHz	389	596	2KHz	204	311

Remarks			20KHz	384	491
CPU High N = 100KHz × 289			30KHz	484	591
PLL High N = CPU High N + 107			90KHz	1084	1191
CPU Low N = 100Hz ~ 10KHz + 184			99KHz	1174	1281
PLL Low N = CPU Low N + 107			99.9KHz	1183	1290

#### 8. RIT ON/OFF circuit

The RIT SW signal of J2 is passed through the chattering absorbing circuit (composed of R32  $\sim$  R34, C31 and C32), and then fed to the IC8A flip-flop. Its Q output and T8V are fed to the OR gate, consisting of D10 and D11, and that output switches Q7 and Q6, resulting in RIT ON/OFF.

When the tuning control is turned, the IC13 Q1 output signal passed through S1 and R36 is fed to the IC8A CL terminal, and RIT is turned OFF.

R31 and Q5 function to stop this operation while the RIT switch is depressed. IC8A Q output switches Q4 and illuminates the RIT LED.

#### 9. Other circuits

#### (a) Remote control bus circuit

The RC signal from J6 is fed to  $A_1$  input terminal of the CPU through the AND gate consisting of R22, D3 and D4. The RC signal is only fed to the CPU when IC6 Q2 is H-level. This input causes remote control operation. The input/output data of the remote control is transferred on the bus line DB1  $\sim$  DB4. Control signals RT and DBC, which control that input/output, are input from the J6 terminals, and switched at A and B of IC1, switching gates synchronizing with Q3 output of IC6, and are then fed to the CPU. Control output DV is output from  $I_2$  port, passes through D15, and is output to the J6 DV terminal.

#### (b) Transverter control circuit

TTL level signals input to TRV A and TRV B terminals of J6 are fed to two switching gates (C and D of IC1) synchronized to Q5 output of IC6, and fed to the CPU.

#### (c) Reset circuit

The CPU reset circuit is composed of Q8, R58  $\sim$  R60 and C51. It functions to assure activation when the CPU power supply is switched ON.

## (d) Display unit

IC1 is a seven-segment display IC capable of displaying 8 digits, with latch buffers, to provide a dynamic illumination display with these data in sequence. C18 is a clock timing capacitor, and IC1 outputs  $T_0 \sim T_7$  signals in sequence by means of the clock oscillator in the IC1. The dynamic illumination display is made by outputting 7-segment data, a  $\sim$  g synchronized to  $T_0 \sim T_7$  signals.

To display a frequency and mode, data are input to  $S_0 \sim S_3$  terminals, the load signal to CTL terminal and these are repeated eight times until inputting in full digits is completed.

The circuit composed of three AND gates of IC2 and Q3  $\sim$  Q7 is used to display those letters which are not available in the characters prepared in expressing operating modes, as follows:

Mode	Display	Character	Unused segment
USB	U	0	a a
LSB	L	Ь	c, g
cw	Ľ	8	c, g f g b
AM	R	8	d e c
RTTY	r	c	d d
FM	F	8	b,c,d

The four AND gates (IC2A  $\sim$  D) are controlled by the timing signals (a  $\sim$  d) from the logic unit and T<sub>7</sub> of IC1.

Q2 is controlled by the TRV D signal during transverter input, 10-MHz digit indication is erased, and Q1 extinguishes the mode indication, by the RC signal from the logic unit, until the band signal is acknowledged within the CPU.

IC3 is for display; it is a DC-DC converter (-10V power supply). Display tube heater voltage is from H output; negative voltage for display is output at -14V and supplied. The -10V is output from J1 to the negative power supply necessary at each part.
