

SERVICE MANUAL

VHF MARINE TRANSCEIVER

IC-M423
IC-M424

S-14905XZ-C1
May. 2012

INTRODUCTION

This service manual describes the latest technical information for the **IC-M423/IC-M424 VHF MARINE TRANSCEIVER**, at the time of publication.

MODEL	VERSION	COLOR
IC-M424	USA	Black
	USA-01	Super white
IC-M423	UK	Black
	EUR	
	HOL	
	FRG	
	CHN	
	AUS	Super white
	UK-01	
	EUR-01	
	HOL-01	
	FRG-01	
	CHN-01	
	AUS-01	

CAUTION

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than the specified voltage. This will ruin the transceiver.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front-end.

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

(IC-M423)

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit Icom part number
2. Component name
3. Equipment model name and unit name
4. Quantity required

<ORDER EXAMPLE>

1110003491	S.IC	TA31136FNG	IC-M423	MAIN UNIT	5 pieces
8820001210	Screw	2438 screw	IC-M424	Top cover	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure that the problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool MUST be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a Standard Signal Generator or a Sweep Generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a Deviation Meter or Spectrum Analyzer, when using such test equipment.
8. **READ** the instructions of the test equipment thoroughly before connecting it to the transceiver.

SPECIFICATIONS

		[UK], [UK-01], [EUR], [EUR-01], [HOL], [HOL-01], [FRG], [FRG-01]		[USA], [USA-01], [CHN], [CHN-01], [AUS], [AUS-01]		
GENERAL	• Frequency coverage	TX	156.000–161.450 MHz	156.025–157.425 MHz		
		RX	156.000–163.425 MHz	156.050–163.275 MHz [USA], [USA-01], [AUS], [AUS-01] 156.050–162.025 MHz [CHN], [CHN-01]		
		156.525 MHz (CH70)				
	• Mode	FM (16K0G3E), DSC (16K0G2B)				
	• Operating temperature range	−20°C to +60°C; −4°F to 140°F				
	• Current drain (at 12.0 V)	TX high Maximum audio	5.5 A maximum 5.0 A maximum			
	• Power supply requirement (negative ground)	13.8 V DC (10.8–15.6 V DC) nominal		13.8 V DC (11.7–15.9 V DC) nominal		
	• Frequency stability	±1.5 kHz (−20°C to +60°C; −4°F to 140°F)		±10 ppm		
	• Antenna impedance	50 Ω nominal				
	• Dimensions (approximately)	180(W) × 82(H) × 119.9(D) mm; 7.1(W) × 3.2(H) × 4.7(D) in				
	• Weight (approximately)	1.2 kg; 2.6 lb				
TRANSMITTER	• Output power	25 W/1 W				
	• Modulation system	Variable reactance frequency modulation				
	• Maximum frequency deviation	±5.0 kHz				
	• Spurious emissions	Less than 0.25 μW	Less than −70 dBc (High power) Less than −56 dBc (Low power)			
	• Adjacent channel power	More than 70 dB				
	• Audio harmonic distortion	Less than 10% (at 60% deviation)				
	• Residual modulation	More than 40 dB				
	• Audio frequency response	+1 dB to −3 dB of 6 dB octave from 300–3000 Hz				
	• Microphone impedance	2 kΩ				
RECEIVER (Main channels)	• Receive system	Double conversion superheterodyne				
	• Sensitivity	−5 dBμ emf (typical) (20 dB SINAD)	−13 dBμ (typical) (12 dB SINAD)			
	• Squelch sensitivity	Less than −2 dBμ emf	Less than −10 dBμ			
	• Intermediate frequency	1st 21.7 MHz, 2nd 450 kHz				
	• Intermodulation rejection ratio	More than 68 dB	More than 70 dB			
	• Spurious response rejection ratio	More than 70 dB				
	• Adjacent channel selectivity	More than 70 dB				
	• Hum and noise	More than 40 dB				
	• Audio frequency response	+1 dB to −3 dB of −6 dB octave from 300–3000 Hz				
	• Audio output power (at 10% distortion with a 4 Ω load)	More than 10 W	10 W (typical)			
RECEIVER (CH70)	• Sensitivity (1% BER)	−4 dBμ emf (typical)	−5 dBμ emf (typical)			
	• Intermediate frequency	1st 30.875 MHz, 2nd 450 kHz				
	• Intermodulation rejection ratio	More than 68 dB (1% BER)				
	• Spurious response rejection ratio	More than 73 dB (1% BER)				
	• Adjacent channel selectivity	More than 73 dB (1% BER)				

All stated specifications are subject to change without notice or obligation.

SECTION 3 DISASSEMBLY INSTRUCTION

1. Removing the FRONT UNIT

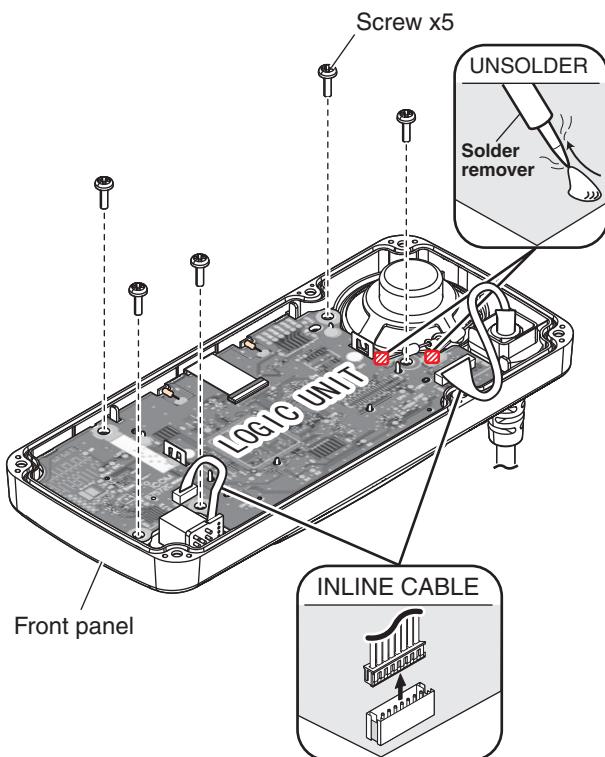

- 1) Remove 6 screws from the rear.
- 2) Disconnect the flat cable and inline cable from the LOGIC UNIT.
- 3) Separate the front panel from the chassis assembly.

BE CAREFUL about the **flat cable** and **connector** when separating the front panel from the chassis assmbly.

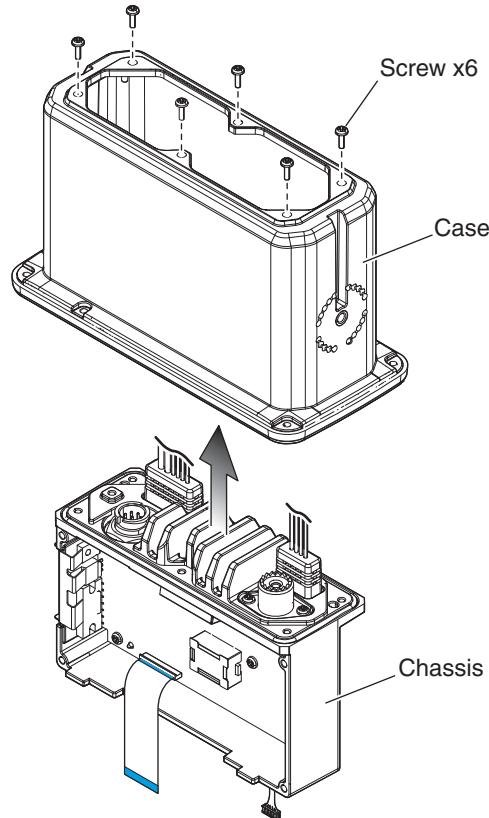

4) Remove 5 screws from the LOGIC UNIT.

- 5) Unsolder 2 points at the speaker.
- 6) Remove the LOGIC UNIT.

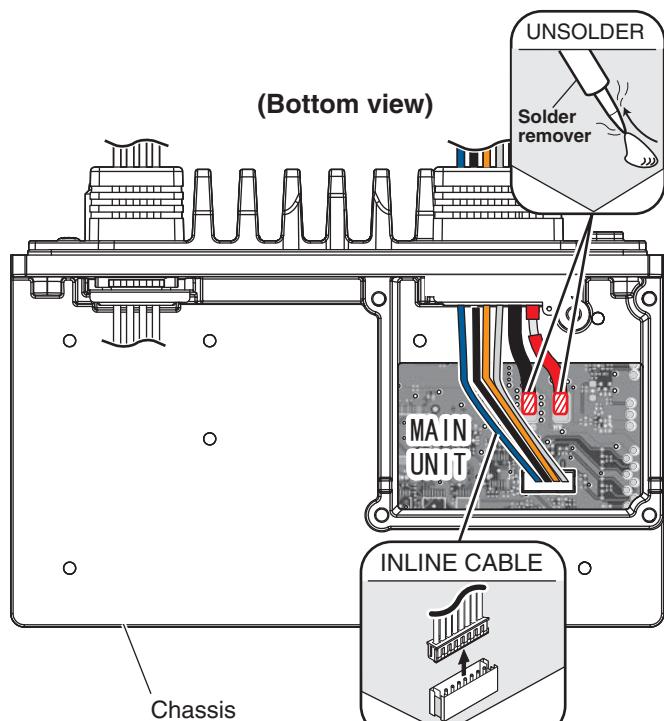

2. Removing the MAIN UNIT

- 1) Remove 6 screws from the rear.
- 2) Remove the case from the chassis.

3) Disconnect the inline cable from the bottom of MAIN UNIT.

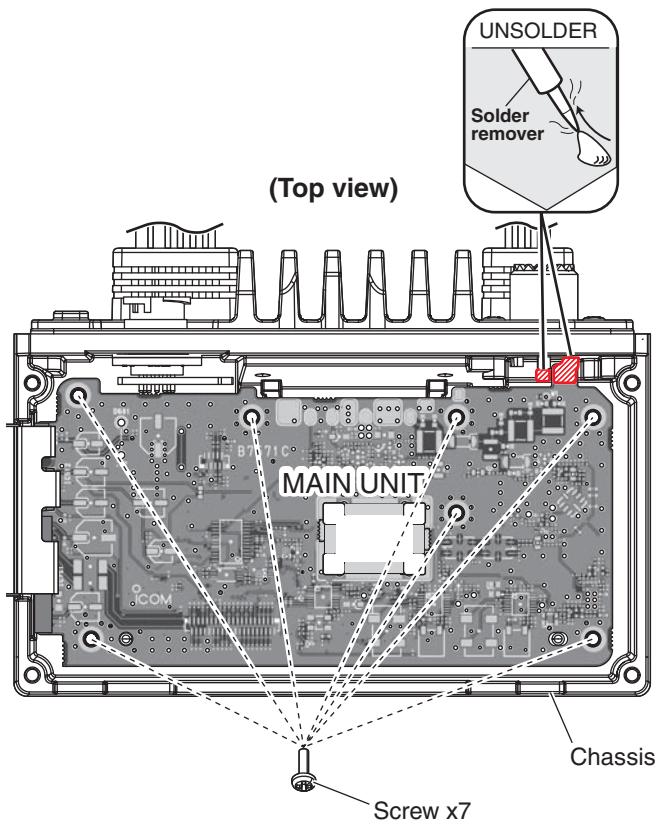

4) Unsolder 2 points at the power supply cable.

(Continued on next page.)

2. Removing the MAIN UNIT (Continued)

- 5) Remove 7 screws from the top of MAIN UNIT.
- 6) Unsolder 2 points at the antenna connector.
- 7) Remove the MAIN UNIT from the chassis.

SECTION 4

CIRCUIT DESCRIPTION

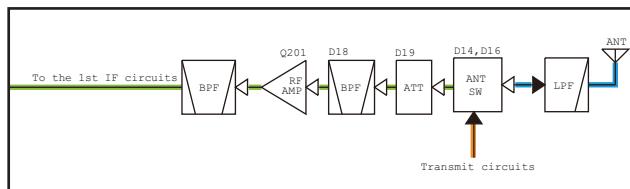

4-1 RECEIVE CIRCUITS

RF CIRCUITS (MAIN UNIT)

The RX signal from the antenna is passed through the LPF (L21, L22, and C114–C116), ANT SW (D16), attenuator (D19, R96) and BPF (L201, C201 and C202), and then applied to the RF AMP (Q201).

The amplified signal is divided and applied to the 1st IF circuits for MAIN CH or CH70, through another BPF (FI201: for MAIN CH; L301–L303 and C301–C308: for CH70).

• RF CIRCUITS

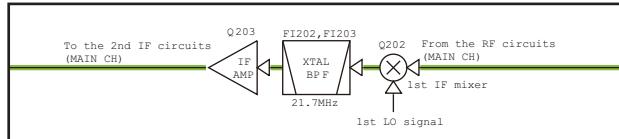

1ST IF CIRCUITS FOR MAIN CHANNELS (MAIN UNIT)

The RX signal from the RF circuits is applied to the 1st IF mixer (Q202), and mixed with the 1st LO signal from the VCO (Q3, Q4 and D1–D3), resulting in a 21.7 MHz 1st IF signal.

The 1st IF signal is filtered by the 1st IF filter (FI202 and FI203), and then applied to the 1st IF AMP (Q203). The amplified signal is applied to the 2nd IF circuits.

• 1ST IF CIRCUITS (For main channels)

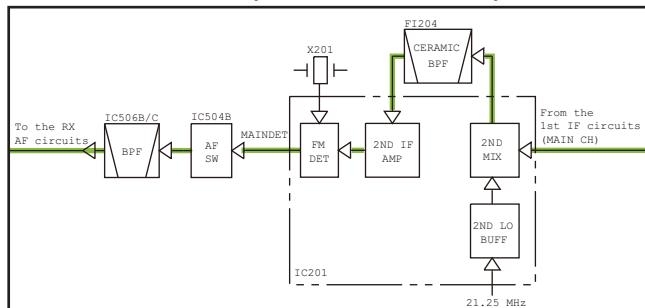

2ND IF CIRCUITS FOR MAIN CHANNELS (MAIN UNIT)

The 1st IF signal from the 1st IF circuits is applied to the IF IC (IC201, pin 16). The IF IC contains the 2nd IF mixer, 2nd IF AMP, detector, and so on, in its package.

The 1st IF signal is mixed with the 21.25 MHz 2nd LO signal from the reference frequency oscillator (TCXO: X101), resulting in a 450 kHz 2nd IF signal. The 2nd IF signal is passed through the 2nd IF filter (FI204) to remove sideband noise. The filtered signal is amplified by the 2nd IF AMP, and demodulated by the quadrature detector with discriminator (X201).

The demodulated AF signal is applied to the RX AF circuits, through the AF SW (IC504B, pins 4, 3).

• 2ND IF CIRCUITS (For main channels)

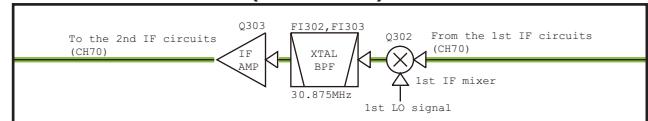

1ST IF CIRCUITS FOR CH70 (MAIN UNIT)

The RX signal from the RF circuits is applied to the 1st IF mixer (Q302), and mixed with the 125.649 MHz 1st LO signal which is generated by the TCXO (X401) and tripled by the BPF (L402, L403 and C412–C416), resulting in a 30.875 MHz 1st IF signal.

The 1st IF signal is filtered by the 1st IF filters (FI302 and FI303), and then applied to the 1st IF AMP (Q303). The amplified signal is applied to the 2nd IF circuits.

• 1ST IF CIRCUITS (For CH70)

2ND IF CIRCUITS FOR CH70 (MAIN UNIT)

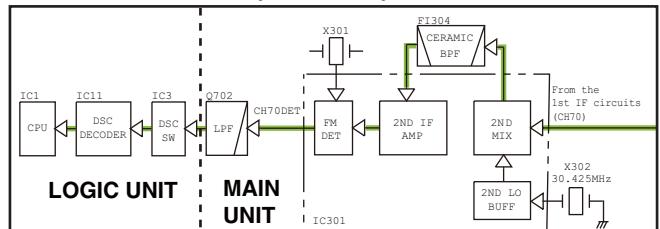

The 1st IF signal from the 1st IF circuits is applied to the IF IC (IC301, pin 16). The IF IC contains the 2nd IF mixer, 2nd IF AMP, detector, and so on, in its package.

The 1st IF signal is mixed with the 30.425 MHz 2nd LO signal which is generated by 2nd LO oscillator (X302), resulting in a 450 kHz 2nd IF signal. The 2nd IF signal is passed through the 2nd IF filter (FI304) to remove sideband noise. The filtered signal is amplified by the 2nd IF AMP, and demodulated by the quadrature detector with discriminator (X301).

The demodulated AF (FSK; Frequency Shift Keying) signal is applied to the DSC decoder (LOGIC UNIT: IC11, pin 2) which converts the sub audible tone signal into serial data, through the LPF (Q702) and DSC SW (LOGIC UNIT: IC3, pins 7, 1).

The serial data is applied to the CPU (LOGIC UNIT: IC1, pin 103) to control the transceiver (emergency alarm, DSC indication and so on.).

• 2ND IF CIRCUITS (For CH70)

RX AF CIRCUITS (MAIN UNIT)

The demodulated AF signal from the AF SW (IC504B) is passed through the BPF (IC506B, IC506C) and AF SW (IC901, pins 7, 1), and then applied to the noise canceller IC (IC902).

The processed AF signal is passed through the LPF (IC905, pins 1, 4) and AF SW (IC904, pins 1, 7).

- **When the AF signal is output to the front panel or HM-196**

The RX AF signal from the AF SW (IC904, pins 1, 7) is passed through the AF MUTE SW (IC503B, pins 3, 4) and amplified by the AF AMP (IC515B). The amplified signal is applied to the D/A converter (IC514, pins 1, 2) to be adjusted in level.

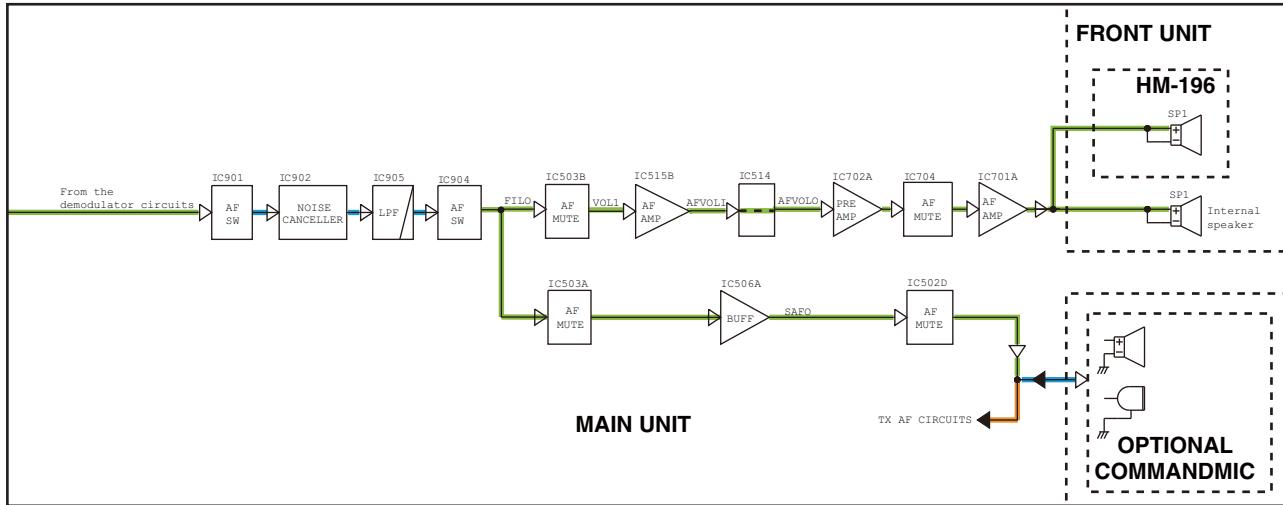

The level-adjusted AF signal is amplified by the AF AMP (IC702A), and then applied to the AF power AMP (IC701A, pin 1), through the AF mute SW (IC704, pins 3, 1).

The amplified signal is output to the internal speaker (CHASSIS: SP1) or HM-196, through the LOGIC UNIT.

- **When the AF signal is output to the optional COMMANDMICIV™**

The RX AF signal from the AF SW (IC904, pins 1, 7) is passed through the AF MUTE SW (IC503A, pins 2, 1) and amplified by the buffer (IC506A), and then output to the COMMANDMICIV™, through the AF mute SW (IC502D, 11, 10).

• RX AF CIRCUITS

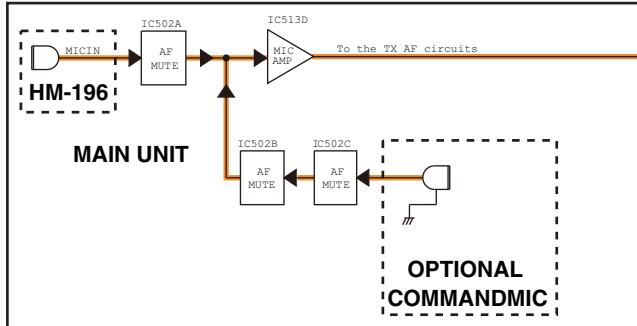

4-2 TRANSMIT CIRCUITS

TX AF CIRCUITS (MAIN UNIT)

The AF signal from the microphone (MIC signal) is passed through the MIC mute SW (IC502A, pins 1, 2), and then applied to the MIC AMP (IC513D).

The MIC signal from the COMMANDMICIV™ is passed through the MIC mute SWs (IC502C, pins 9, 8 and IC502B, pins 4, 3), and then applied to the MIC AMP (IC513D).

• MIC AMP CIRCUITS

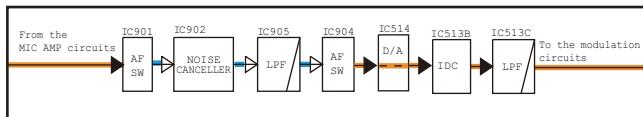

TX AF CIRCUITS (MAIN UNIT)

The amplified AF signal is passed through the AF SW (IC901, pins 6, 1) and applied to the noise canceller IC (IC902, pin 36).

The processed AF signal is passed through the LPF (IC905, pins 1, 4) and AF SW (IC904, pins 1, 6), and then applied to the D/A converter (IC514, pins 13, 14) to be adjusted in level.

The level-adjusted AF signal is applied to the IDC AMP (IC513B) which limits the amplitude of MIC signal to prevent over deviation. The amplitude-limited signal is passed through the LPF (IC513C), and then applied to the modulation circuits.

• TX AF CIRCUITS

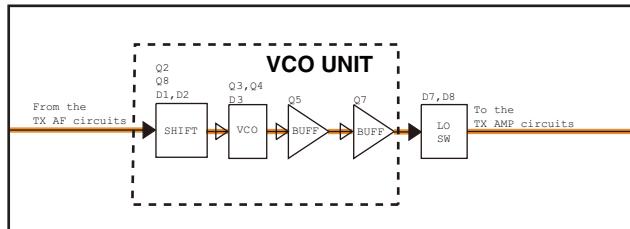

MODULATION CIRCUITS (MAIN UNIT)

The MIC signal from the TX AF circuits is applied to the VCO (Q3, Q4 and D1–D3). The modulation signal is applied to D2, to obtain Frequency Modulation.

The modulated VCO output signal is passed through the buffers (Q5 and Q7), and then applied to the TX AMP circuits as a TX signal, through the LO SW (D7).

• MODULATION CIRCUITS

TX AMP CIRCUITS (MAIN UNIT)

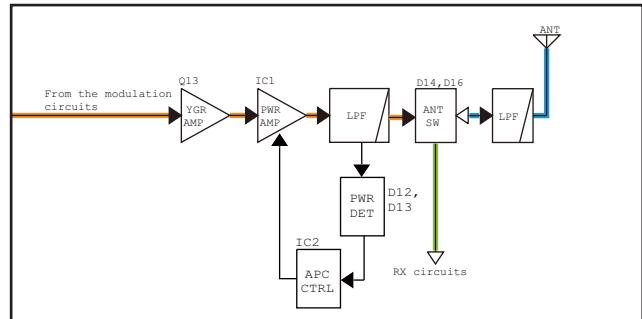

The TX signal is amplified by the YGR (Q13) and power AMP (IC1), and then passed through the LPF (L2, C111 and C112), TX output power detector (D12 and D13), ANT SW (D14), and two LPF (L21, L22, and C114–C116), before being sent to the antenna.

APC CIRCUITS (MAIN UNIT)

The voltage produced at the LPF (L20, C111, and C112) is rectified by D12 and D13, and is used as the TX power sensing voltage.

The voltage is applied to the APC AMP (IC2, pin 3), and the output voltage controls the gate bias voltage of power AMP (IC1) to keep the TX output power constant.

• TX AMP CIRCUITS

4-3 FREQUENCY SYNTHESIZER (MAIN UNIT)

• VCO

The VCO (Q3, Q4, and D1–D3) generates both 1st LO signal for MAIN channels and the TX signal.

The output of buffer (Q7) is used as the TX or RX LO signal.

While receiving, the LO signal is applied to the 1st IF mixer for MAIN channels (Q202), through the LO SW (D8) and LPF (L206 and L207).

While transmitting, the LO signal is applied to the TX AMP circuits, through the LO SW (D7).

• PLL

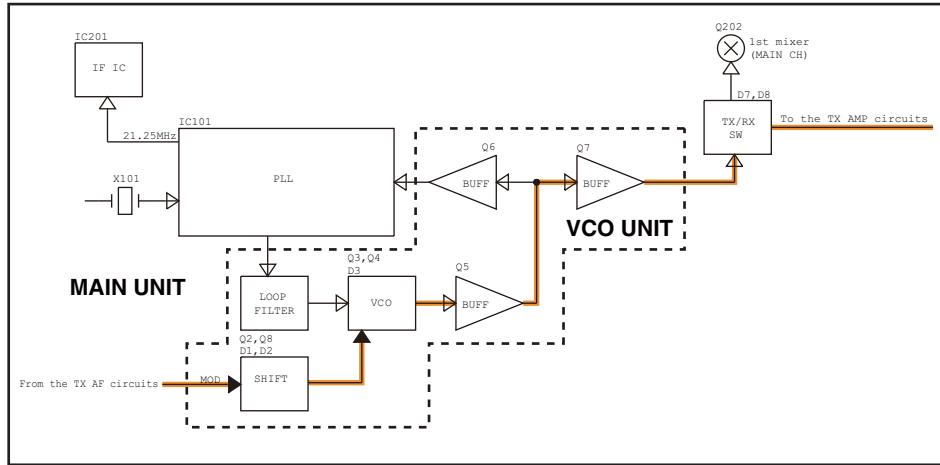

A portion of VCO output signal is passed through two buffers (Q5 and Q6), and then fed back to the PLL IC (IC101, pin 16).

The PLL IC (IC101) phase-compares the outputs of the reference frequency oscillator (TCXO; X101) and VCO, and the phase-difference is output as the charge pump current.

The current is passed through the loop filter (R1–R3, C1–C3, and C10) to be converted into the lock voltage, which controls the oscillating frequency of VCO.

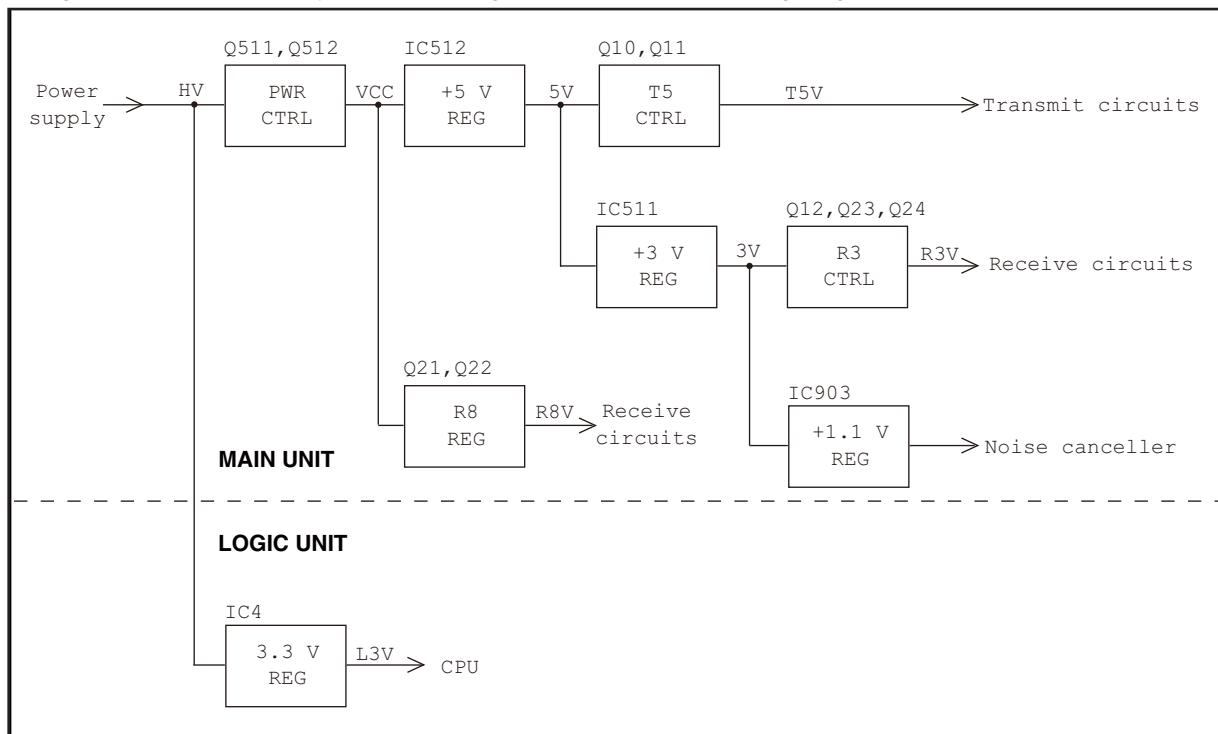

When the oscillation frequency drifts, its phase changes from that of the reference frequency, causing a lock voltage change to compensate for the drift in the VCO oscillating frequency.

• FREQUENCY SYNTHESIZER CIRCUITS

4-4 VOLTAGE BLOCK DIAGRAM

Voltage from the power supply is routed throughout the transceiver, through regulators and switches.

J2	6910003831	CON IMSA-9230B-1-04Z003-PT1		

Eqv.= This component is equivalent to the REF No. component listed above, and may be substituted on parts orders and repairs.

M.=Mounted side (T: Mounted on the Top side, B: Mounted on the Bottom side)
S.=Surface mount

BOARD LAYOUTS

The combination of top side and bottom side of this page shows the actual configuration of P.C. board.
