## INTRODUCTION

The Model 2000 is a bench top single output power supply. The power supply has two meters for monitoring output voltage and current.

The 2000 will find wide application in schools, laboratories, and commercial engineering and testing departments, as well as with the advanced hobbieist.

## BEFORE WE BEGIN

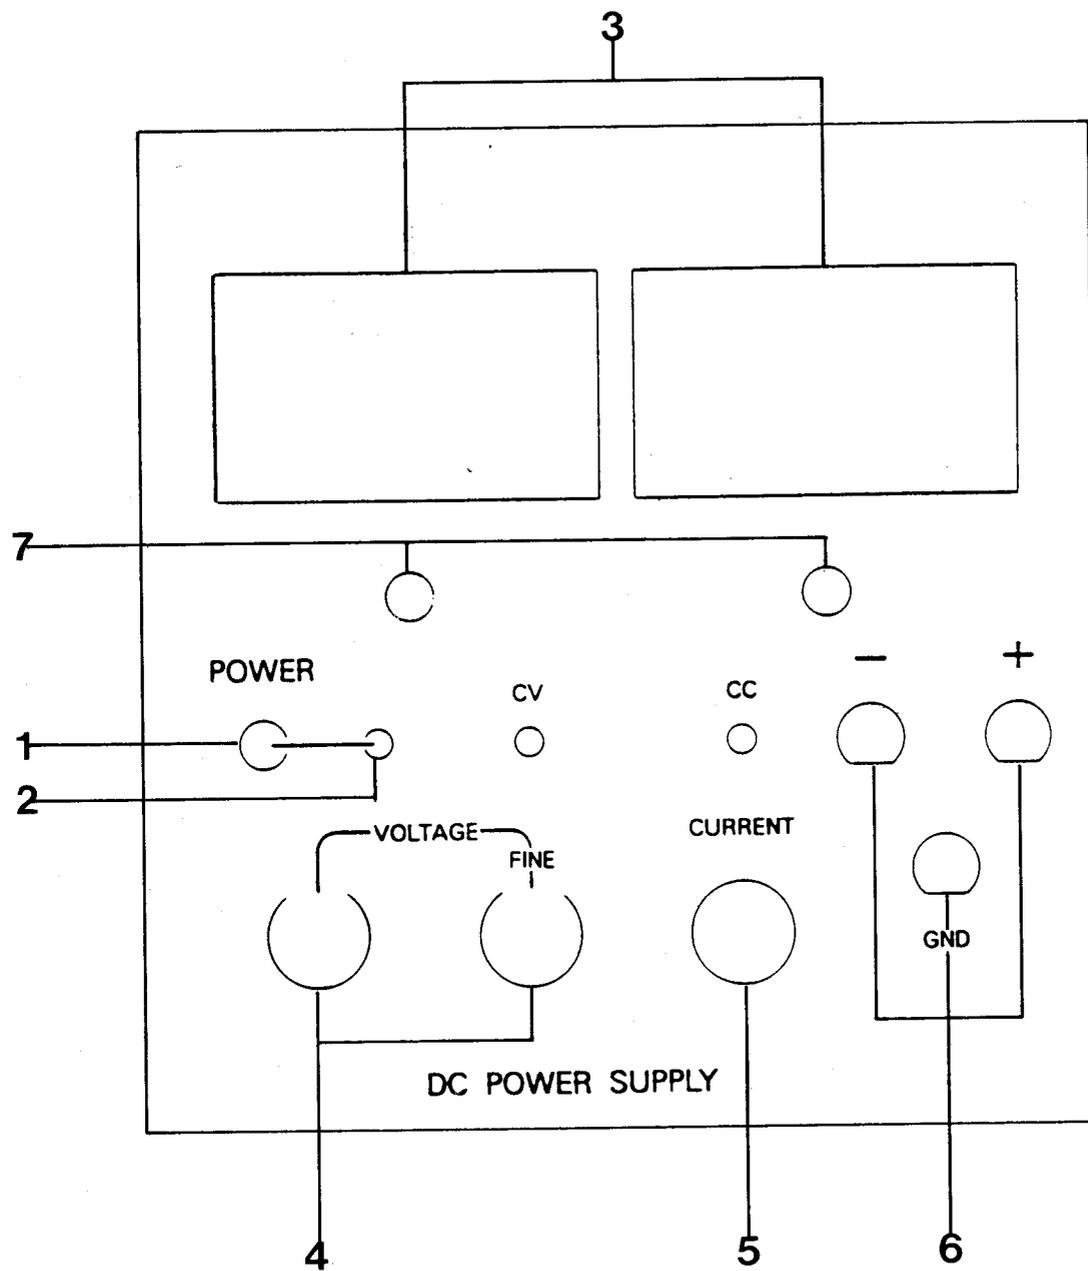

The Model 2000 is packed in styrofoam to protect it during shipment from the factory. You should keep this material, as well as the shipping box, in case your unit must be moved or shipped again.

The box should include the following items:

- Model 2000 Series power supply
- Removeable AC line cord
- Banana plug to Alligator clip cables
- Instruction manual

Please check to see that all of the above items are included.

Figure - 1

## FRONT PANEL DESCRIPTION

The following is the explanation of the function of each of the front panel controls and connectors. You should refer to Figure 1 for the location of each control/connector.

1. **POWER ON** - This is the main power switch.
2. **POWER ON LED** - This LED indicates that the power is on.
3. **VOLTAGE/CURRENT METERS** - These two meters indicate the output voltage and current as measured at the output terminals.
4. **VOLTAGE ADJUST** - These two controls (main & fine - Models 2203, 2302, 2303, 2601 only) adjust the output voltage of the supply.
5. **CURRENT ADJUST** - This control adjusts the output current that the supply will put out.
6. **OUTPUT TERMINALS** - There are three terminals. They represent positive, negative and ground.
7. **METER ZERO** - Each meter has a mechanical screw adjustment for setting the zero point.

## OPERATING INSTRUCTIONS

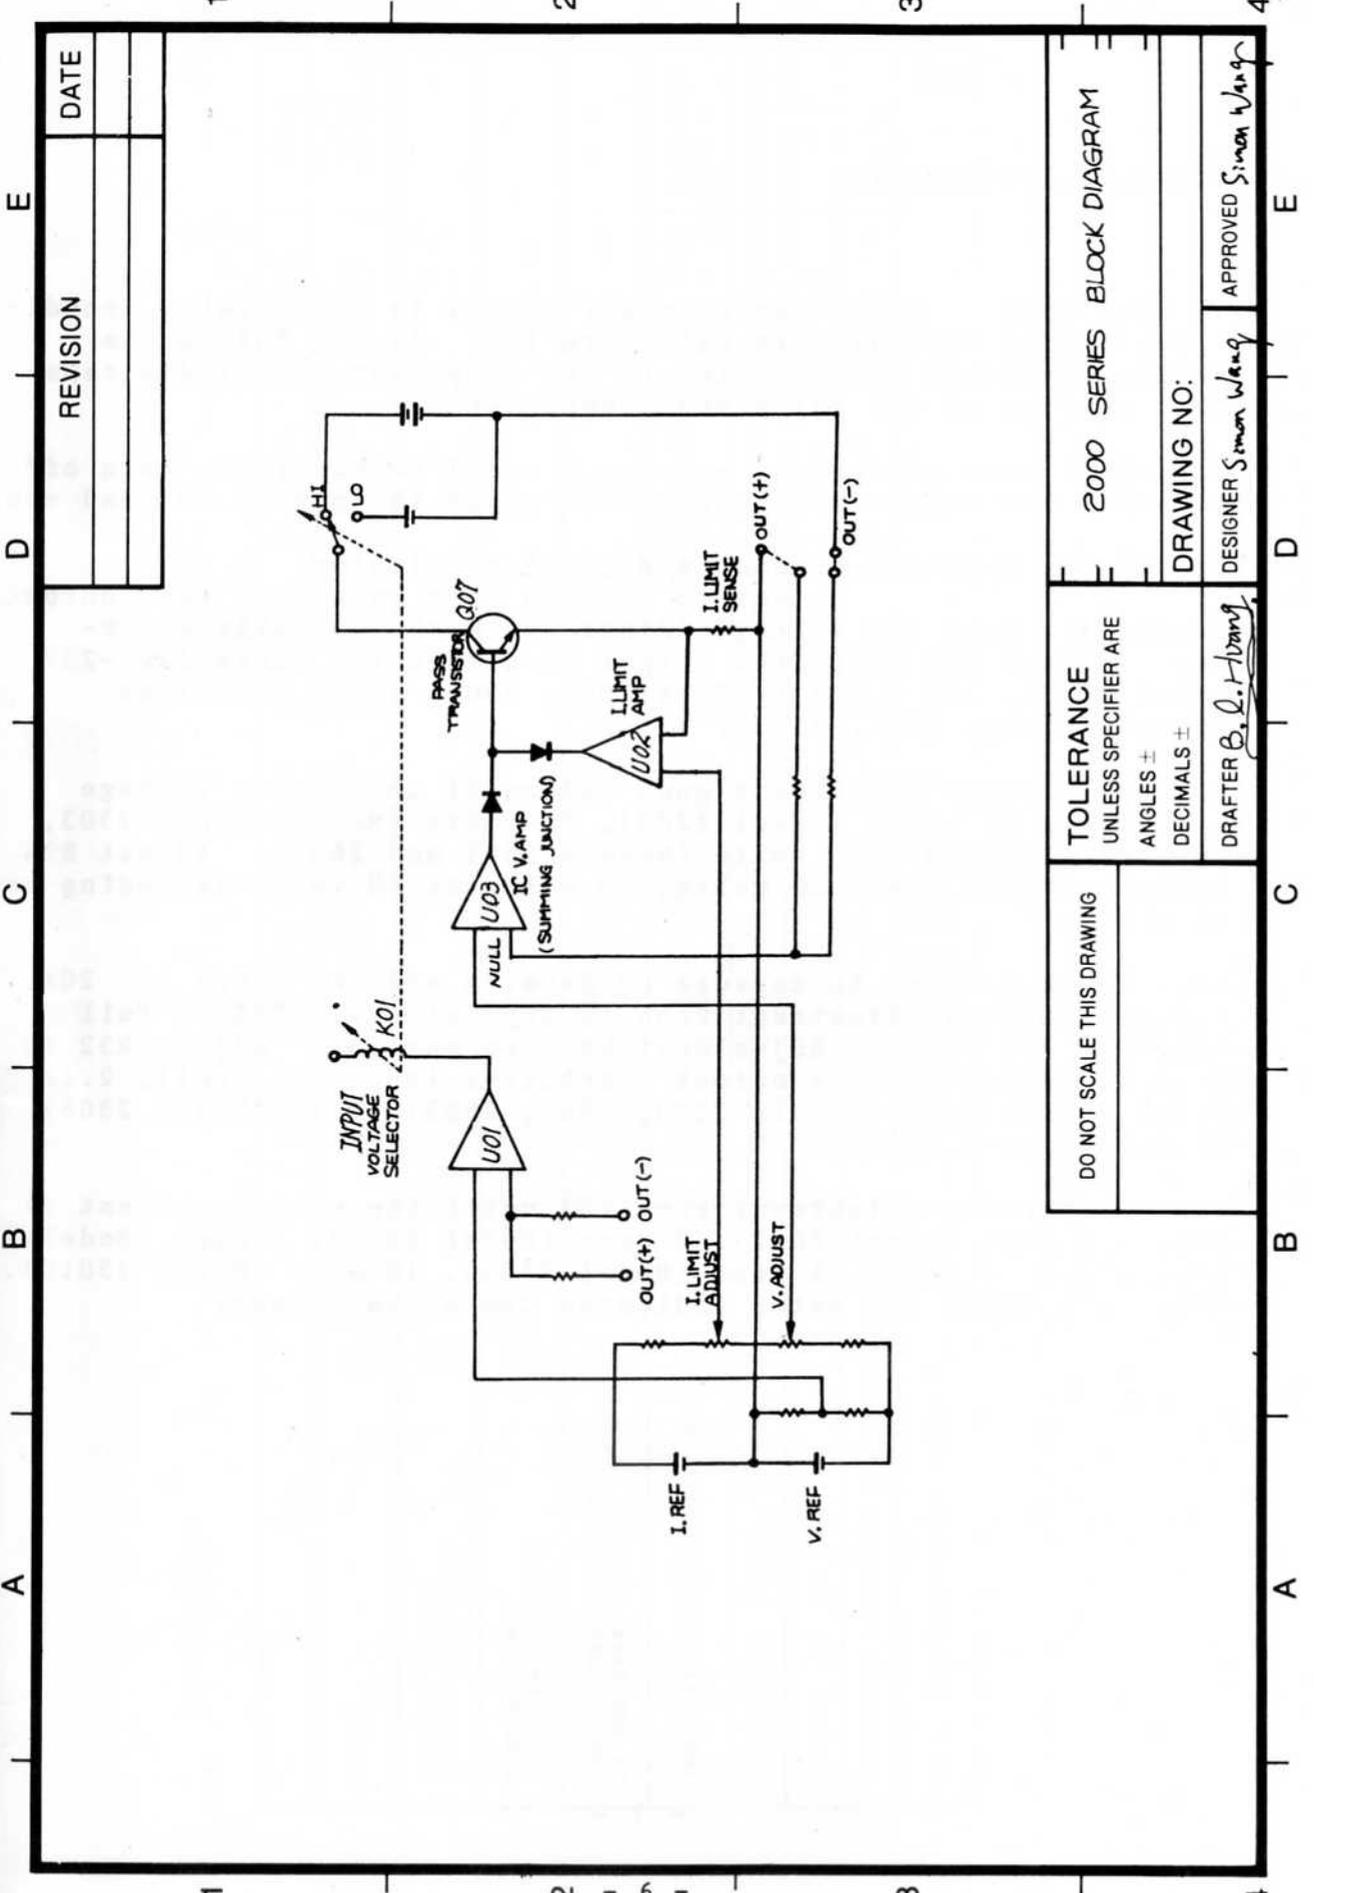

**WARNING** - Before applying power to your 2000 Series power supply, make sure that the AC input voltage setting SW03 and SW04 on rear panel is correctly set for your available power.

1. Connect the instrument to an AC power source using the line cord provided and turn the POWER ON switch (1) on. For maximum stability, allow the instrument to warm up for at least 20 minutes
2. Set the voltage and current adjustment knobs as you desire.

## OPERATING CAUTIONS

Please follow the following cautions when using your Model 2000 Series power supply to prevent damage to the unit.

1. Verify that the AC voltage setting is the same as your available power BEFORE you apply power the instrument.
2. Do not connect a voltage that is greater than the current output voltage to the terminals of the instrument.
3. Do not parallel the output of 2000 series.

## MAINTENANCE & CALIBRATION

To keep your 2000 Series power supply in top working condition, you should periodically calibrate it. As you follow the adjustment procedure below, refer to the component layout diagrams for the location of the adjustment components.

1. Mechanical zero adjustment - Using a small screwdriver, turn off the power and adjust the four screws under the meters to read zero.
2. Turn on the unit and connect a digital multimeter set to the 200 volt range to the output terminals. Turn the Voltage Adjustment knob (4) fully clockwise. Adjust R33 until the output is within the range 21V -23V (Model 2203), 31V - 33V (Models 2302, 2303, 2306, 23010) or 62V-65V (Models 2601, 2603).
3. Turn the Voltage Adjustment knob (4) until the output voltage is exactly 20 volts (Model 2203), 30 volts (Models 2302, 2303, 2306 and 23010) or 60 volts (Models 2601 and 2603). Adjust R34 until the meter reads 20 volts, 30 volts or 60 volts depending on the model.
4. Set the multimeter to measure DC amperes and the range to 20A. Turn the Voltage Adjustment knob to approximately 25% of full scale and the Current Adjustment knob to maximum. Adjust R32 in order to have a minimum output current: 1.1A (Model 2601), 2.1A (Model 2302), 3.1A (Models 2203, 2303, 2603), 6.1A (Model 2306) or 10.1A (Model 23010).
5. Turn the Current adjustment knob (5) until the output current is exactly 1 amps (Model 2601), 2 amps (Model 2302), 3 amps (Models 2203, 2303, or 2603), 6 amps (Model 2306), 10 amps (Model 23010). Adjust R35 until the meter indicates the above values.

# TROUBLESHOOTING

## 1. Control Section for Power Supply and Correct Reference Voltage

- A. Check to be sure that voltage select switch on bottom rear panel is switched to correct line voltage.
- B. With power on, check CC, CV, and power LED. If there is indication of functional error, turn off power. Then check transformer and fuse on rear panel.
- C. Turn on power again and consult circuit diagram. There are two diode bridge circuits. The upper one from D01 to D04 is for the main power source. The lower one from D05 to D08 is for the control circuit and the reference voltage generator.
- D. Check to be sure that the Q05 emitter is set at a positive reading of  $9.6V \pm 10\%$  and that the Q06 emitter is set at a negative reading of  $11.5V \pm 10\%$ . The DMM GND (negative) clip must be clipped to the main output (positive) terminal.
- E. Check CR03 to be sure that CR03 shows a positive reading of  $3.3V \pm 10\%$  and that CR04 shows a negative reading of  $8.2V \pm 10\%$

## 2. Voltage Control Circuit

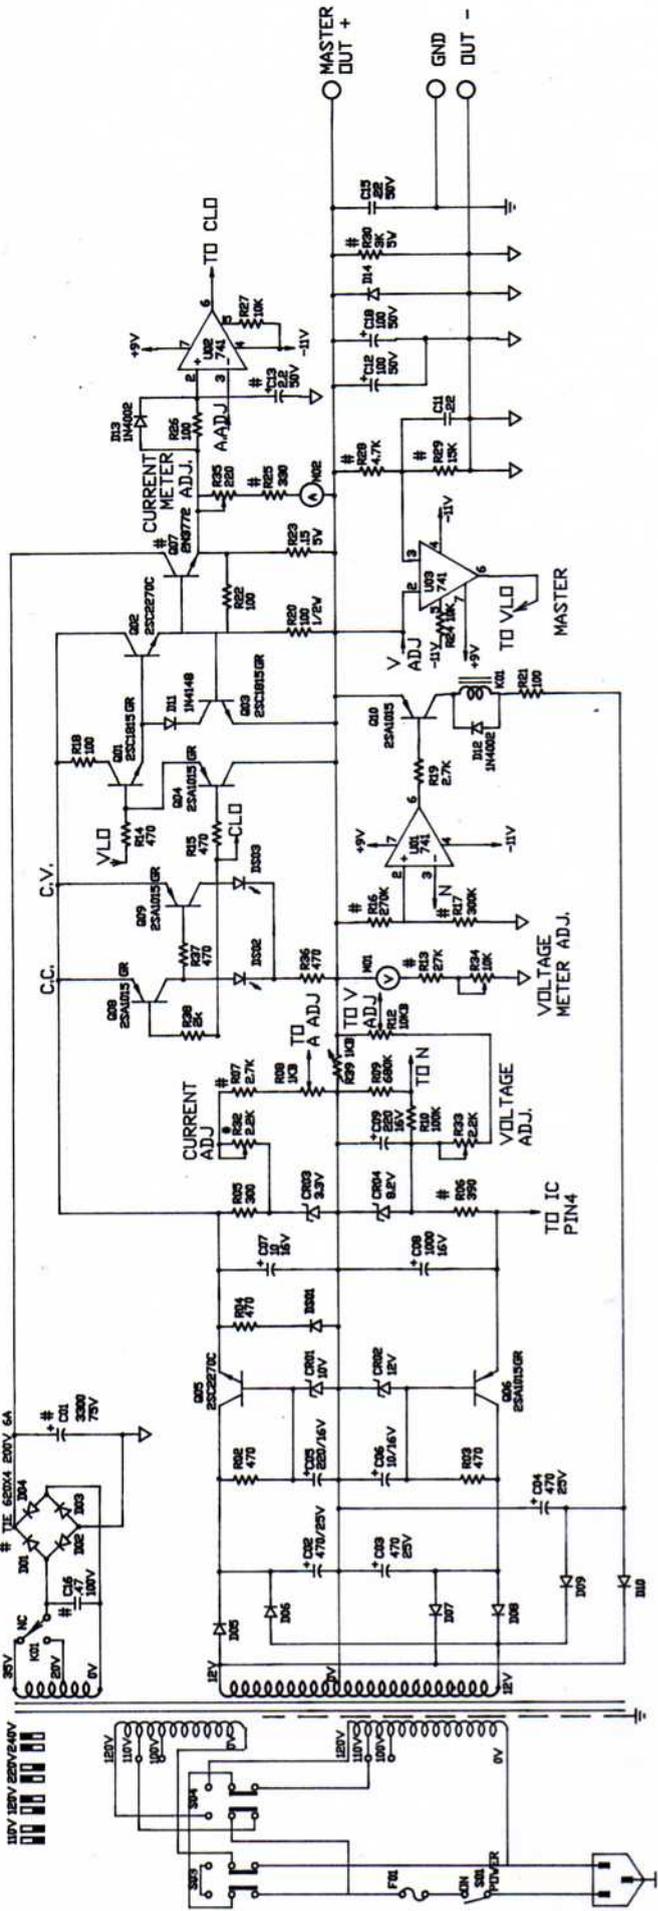

- A. Turn the voltage verniers (main and fine) to minimum and the current vernier to maximum. Check to be certain that the U03 pin 6 shows a reading of from  $-5V$  to  $-12V$ .
- B. Then turn the voltage vernier to maximum and check to see that U03 pin 6 shows a reading of  $+2V \pm 20\%$ .
- C. Please note that the positive voltage control current passes through Q01, Q02, and Q07.
- D. The voltage meter is controlled by the voltage verniers.

### 3. Current Control Circuit

- A. Turn the current vernier to minimum. Check to be sure that the U02 output shows a reading of from -5V to -9V.
- B. Turn both voltage verniers to maximum.
- C. Connect the positive output terminal and the negative output terminal with a 5 Ohm 50W resistor or similar component.
- D. The current meter is controlled by the current vernier.

### 4. Relay Circuit and the CC and CV LED

- A. The U01 relay control IC is controlled by the output voltage. At approximately half of maximum output the relay will change state. Please note that with specially ordered power supplies there may be a four state relay change.
- B. The CC LED is controlled by the constant current mode. Otherwise it will be controlled by the constant voltage mode.

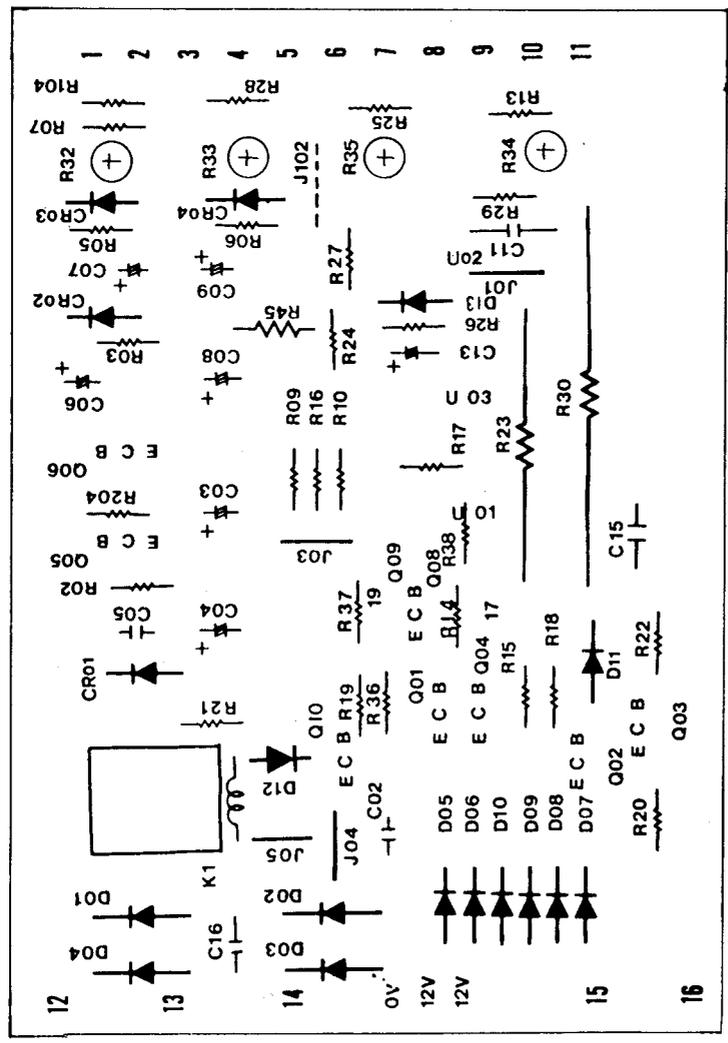

- NOTES
1. ALL RESISTOR VALUES ARE IN OHMS UNLESS OTHERWISE SPECIFIED.
  2. ALL CAPACITOR VALUES ARE IN MICROFARADS.
  3. # DENOTE VALUES OF 2000 SERIES WHICH ARE DIFFERENT.
  4. ↓ DENOTE CHASSIS CONNECTION.
  5. ↓ DENOTE OUTPUT- CONNECTION.
  6. THE FOLLOWING TABLE SPECIFIES THE DIFFERENCE BETWEEN 2000 SERIES.
