**Introduction**

This manual provides technical information necessary for servicing the FT-7100M FM Transceiver.

Servicing this equipment requires expertise in handling surface-mount chip components. Attempts by non-qualified persons to service this equipment may result in permanent damage not covered by the warranty, and may be illegal in some countries.

Two PCB layout diagrams are provided for each double-sided circuit board in the repeater. Each side of is referred to by the type of the majority of components installed on that side (“leaded” or “chip-only”). In most cases one side has only chip components, and the other has either a mixture of both chip and leaded components (trimmers, coils, electrolytic capacitors, ICs, etc.), or leaded components only.

While we believe the technical information in this manual to be correct, VERTEX STANDARD assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

## VHF Reception

Incoming VHF signals are passed through a low-pass filter network, antenna switching diodes **D1056 (1SS355)** and **D1057 (RLS135)**, and a high-pass filter network, and on to the RF amplifier **Q1007 (3SK131)**. The amplified RF signal is passed through another RF amplifier **Q1011 (2SC5226)** and band-pass filtered again by varactor-tuned resonators L1022, L1029, L1034 and **D1009, D1012, D1014** (all **HVU359**), then applied to the 1st mixer **Q1023 (3SK228)** along with the first local signal from the PLL circuit.

The first local signal is generated between 122.3 MHz and 126.3 MHz by the VHF VCO, which consists of **Q1025 (2SC5006)** and varactor diodes **D1023, D1024, and D1066** (all **HSV362**) according to the receiving frequency.

The 21.7 MHz first IF signal is applied to monolithic crystal filters **XF1003** and **XF1004** (both **21R12B5**) which strip away unwanted mixer products, and the IF signal is applied to the first IF amplifier **Q1032 (2SC4400)**. The amplified first IF signal is then delivered to the FM IF subsystem IC **Q1043 (TK10931V)**, which contains the second mixer, limiter amplifier, noise amplifier, and FM detector.

The second local signal is generated by 21.25 MHz crystal X1002 and **Q1060 (2SC5374)**, producing the 450 kHz second IF signal when mixed with the first IF signal within Q1043.

The 450 kHz second IF signal is applied to the ceramic filter **CF1002 (ALFYM450F)** which strips away all but the desired signal, and then passes through the limiter amplifier within Q1043 to the ceramic discriminator **CD1002 (CDBM450C7)**, which removes any amplitude variations in the 450 kHz IF signal before detection of speech.

The detected audio passes through the de-emphasis network, a high-pass filter consisting of **Q1088 (NJM2902V-3)** and associated circuitry, and a low-pass filter consisting of **Q1088 (NJM2902V-4)** and associated circuitry. The filtered audio signal is amplified by **Q1047 (NJM2902V-1)**, then passes through the audio volume control IC **Q1096 (M511312FP)** which adjusts the audio sensitivity to compensate for audio level variations, and then is delivered to audio switch **Q1094 (BU4053BCFV)**.

When the internal speaker is selected, the audio signal is amplified by **Q1098 (TDA7233D)**, then applied to the internal loudspeaker. When the external speaker is selected, the audio signal is amplified by **Q1097 (TDA2003H)**, then it passes through the EXT SP jack to the external loudspeaker.

## UHF Reception

Incoming UHF signals are passed through a low-pass filter network, high-pass filter network, antenna switching diodes **D1058 (1SS355)** and **D1059 (RLS135)**, and on to the band-pass filter network consisting of varactor diode **D1004 (HVU359)** and L1001.

The filtered UHF signal is amplified by RF amplifier **Q1008 (3SK228)** and fed to another band-pass filter consisting of varactor diode **D1006 (HVU359)** and L1008, and then is passed through another RF amplifier **Q1010 (2SC5226)** to another band-pass filter consisting of varactor diodes **D1010** and **D1011** (both **HVU359**) and L1027/L1030.

The amplified and filtered UHF signal is applied to the 1st mixer **Q1019 (3SK228)** along with the first local signal from the PLL circuit.

The first local signal is generated between 384.95 MHz and 404.95 MHz by the UHF VCO, which consists of **Q1024 (2SC5006)** and varactor diodes **D1020 (1SV281)** and **D1021 (1SV280)**, according to the receiving frequency.

The 45.05 MHz first IF signal is applied to monolithic crystal filters **XF1001** and **XF1002** (both **45M15B5H**) which strip away unwanted mixer products, and the IF signal is applied to the first IF amplifier **Q1029 (2SC4400)**. The amplified first IF signal is then delivered to the FM IF subsystem IC **Q1034 (TA31136FN)**, which contains the second mixer, limiter amplifier, noise amplifier, and FM detector.

The second local signal is generated by 45.505 MHz crystal X1001, producing the 455 kHz second IF signal when mixed with the first IF signal within **Q1034**.

The 455 kHz second IF signal is applied to the ceramic filter **CF1001 (CFW455F)** which strips away all but the desired signal, and then passes through the limiter amplifier within **Q1034** to the ceramic discriminator **CD1001 (CDBM455C7)**, which removes any amplitude variations in the 455 kHz IF signal before detection of speech.

## Circuit Description

The detected audio passes through the de-emphasis network, a high-pass filter consisting of **Q1117 (M5223AGP-1)** and associated circuitry, and a low-pass filter consisting of **Q1117 (M5223AGP-2)** and associated circuitry. The filtered audio signal is amplified by **Q1046 (NJM2902V-3)**, then passes through the audio volume control IC **Q1096 (M511312FP)**, which adjusts the audio sensitivity to compensate for audio level variations, and then is delivered to audio switch **Q1094 (BU4053BCFV)**.

When the internal speaker is selected, the audio signal is amplified by **Q1098 (TDA7233D)** then applied to the internal loudspeaker. When the external speaker is selected, the audio signal is amplified by **Q1097 (TDA2003H)**, then it passes through the **EXT SP** jack to the external loudspeaker.

The amplified RF signal is passed through a high-pass filter network, VHF "sub" RF amplifier **Q1013 (2SC3120)**, and a low-pass filter network, then is applied to the VHF "sub" first mixer **Q1015 (2SC3120)** along with the 255 MHz VHF "sub" first local signal from the PLL circuit.

### VHF Squelch Control

When no VHF carrier is being received, noise at the output of the detector stage in **Q1043** is amplified and band-pass filtered by the noise amp section of **Q1043**, then passes through the noise amplifier **Q1051 (2SC4154E)** to noise detector **D1034 (MC2850)**. The resulting DC voltage is applied to pin 93 of main CPU **Q1075 (M30620ECGP)**, which compares the squelch threshold level to that which set by the front panel VHF **SQL** knob.

While no carrier is received, pin 76 of **Q1075** remains "high," turning on the squelch switch **Q1076 (RT1N241M)** to disable audio output from the speaker.

### UHF Squelch Control

When no UHF carrier is being received, noise at the output of the detector stage in **Q1034** is amplified and band-pass filtered by the noise amp section of **Q1034**, then passes through the noise amplifier **Q1052 (2SC4154E)** to noise detector **D1030 (MC2850)**. ## *Transmit Signal Path*

The speech signal from the microphone passes through the **MIC** jack **J2002** to AF amplifier **Q2011 (M5223AGP)** on the PANEL UNT. The amplified speech signal is subjected to amplitude limiting by **Q2011 (M5223AGP)**, then passes through the panel interface jacks **J2001** and **J1002** to MAIN Unit. A portion of the power amplifier output is rectified by **D1063 (1SS321)**, **D1065 (1SS319)** and **Q1116 (2SC4154E)**, then delivered to APC **Q1045 (NJM2902V)** as a DC voltage which is proportional to the output level of the power amplifier.

The APC **Q1045** compares the rectified DC voltage from the power amplifier and the reference voltage from the main CPU **Q1075**, producing a control voltage for the Automatic Power Controller **Q1114 (RT1P441U)** and **Q1115 (RT1N241M)** which regulates supply voltage to the Pre-Drive amplifier **Q1111**, Drive amplifier **Q1112**, and Power amplifier **Q1113**, so as to maintain stable output power under varying antenna loading conditions.

Meanwhile, pin 86 of **Q1075** goes "low," which disables the VHF Rx circuit.

# Circuit Description

## UHF PTT Circuit

When the **PTT** switch is pressed, pin 46 of sub CPU **Q2007 (M38039FFFP)** goes “1V,” which sends the “PTT” command to the main CPU, **Q1075**. When it receives the “PTT” command, pin81 of **Q1075** goes “high” to controls local switch **D1050**, filter switch **D1051, D1052**, TX switch **D1062** and APC switch **Q1114, Q1115**, which activates the UHF Tx circuit. Meanwhile, pin 82 of **Q1075** goes “low,” which disables the UHF Rx circuit.

## VHF PLL

A portion of the output from the VHF VCO **Q1025 (2SC5006)** passes through buffer amplifiers **Q1021 (2SC5374)** and **Q1040 (2SC3120)** to the programmable divider section of the PLL IC **Q1055 (M64076AGP)**, which divides the frequency according to the frequency dividing data from the main CPU, **Q1075**. It is then sent to the phase comparator.

The 21.25 MHz frequency of the reference oscillator circuit, made up of **X1002** and **Q1060 (2SC5374)**, is divided by the reference frequency divider section of **Q1055** into 4250 or 3400 parts to become 5 kHz or 6.25 kHz comparative reference frequencies, which are utilized by the phase comparator.

The phase comparator section of **Q1055** compares the phase between the frequency-divided oscillation frequency of the VCO circuit and comparative frequency, and its output is a pulse corresponding to the phase difference. This pulse is integrated by the charge pump and loop filter of **Q1055** into a control voltage (VCV) to control the oscillation frequency of the VHF VCO **Q1025**.

## UHF PLL

A portion of the output from the UHF VCO **Q1024 (2SC5006)** passes through buffer amplifier **Q1020 (2SC5374)** and **Q1038 (2SC3120)** to the programmable divider section of the PLL IC **Q1055 (M64076AGP)**, which divides the frequency according to the frequency dividing data from the main CPU **Q1075**. It is then sent to the phase comparator.

The 21.25 MHz frequency of the reference oscillator circuit, made up of **X1002** and **Q1060 (2SC5374)**, is divided by the reference frequency divider section of **Q1055** into 4250 or 3400 parts to become 5 kHz or 6.25 kHz comparative reference frequencies, which are utilized by the phase comparator.

The phase comparator section of **Q1055** compares the phase between the frequency-divided oscillation frequency of the VCO circuit and comparative frequency, and its output is a pulse corresponding to the phase difference. This pulse is integrated by the charge pump and loop filter of **Q1055** into a control voltage (VCV) to control the oscillation frequency of the UHF VCO **Q1024**.

## V/V, U/U Local Oscillator

When the V/V or U/U feature is activated, a portion of the 21.25 MHz reference is amplified and multiplied by twelve by **Q1026 (2SC3120)**, then passes through band-pass filter network to buffer amplifier **Q1031 (2SC3120)**, which provides the first local signal for V/V or U/U operation.

## Power-on Circuit

When the **POWER** switch is turned on, pin 16 of main CPU **Q1075** goes “low.” When pin 16 of **Q1075** goes “low,” pin 61 of **Q1075** goes “high” to activate the power switches **Q1001 (2SA1301)** and **Q1002 (RT1N241M)**, which supply the DC power to the radio.

## *Introduction and Precautions*

The FT-7100M has been carefully aligned at the factory for the specified performance across the 144 MHz and 430 MHz amateur bands. Realignment should therefore not be necessary except in the event of a component failure. All component replacement and service should be performed only by an authorized VERTEX STANDARD representative, or the warranty policy may be voided.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts are replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized VERTEX STANDARD service technicians, who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized VERTEX STANDARD service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, VERTEX STANDARD must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

## *Required Test Equipment*

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

- Regulated DC Power Supply: adjustable from 10 to 17 VDC, 15 A
- RF Signal Generator with calibrated output level at 500 MHz
- Frequency Counter:  $\pm 0.1$  ppm accuracy at 500 MHz
- AF Signal Generator
- SINAD Meter
- Oscilloscope
- Spectrum Analyzer
- Deviation Meter (linear detector)
- AF Milivoltmeter
- AF Dummy Load: 4 Ohms, 5 W
- DC Voltmeter: high impedance
- Inline Wattmeter with 5% accuracy at 500 MHz
- 50-Ohm non-reactive Dummy Load: 100 watts at 500 MHz
- VHF/UHF Sampling Coupler

# Alignment

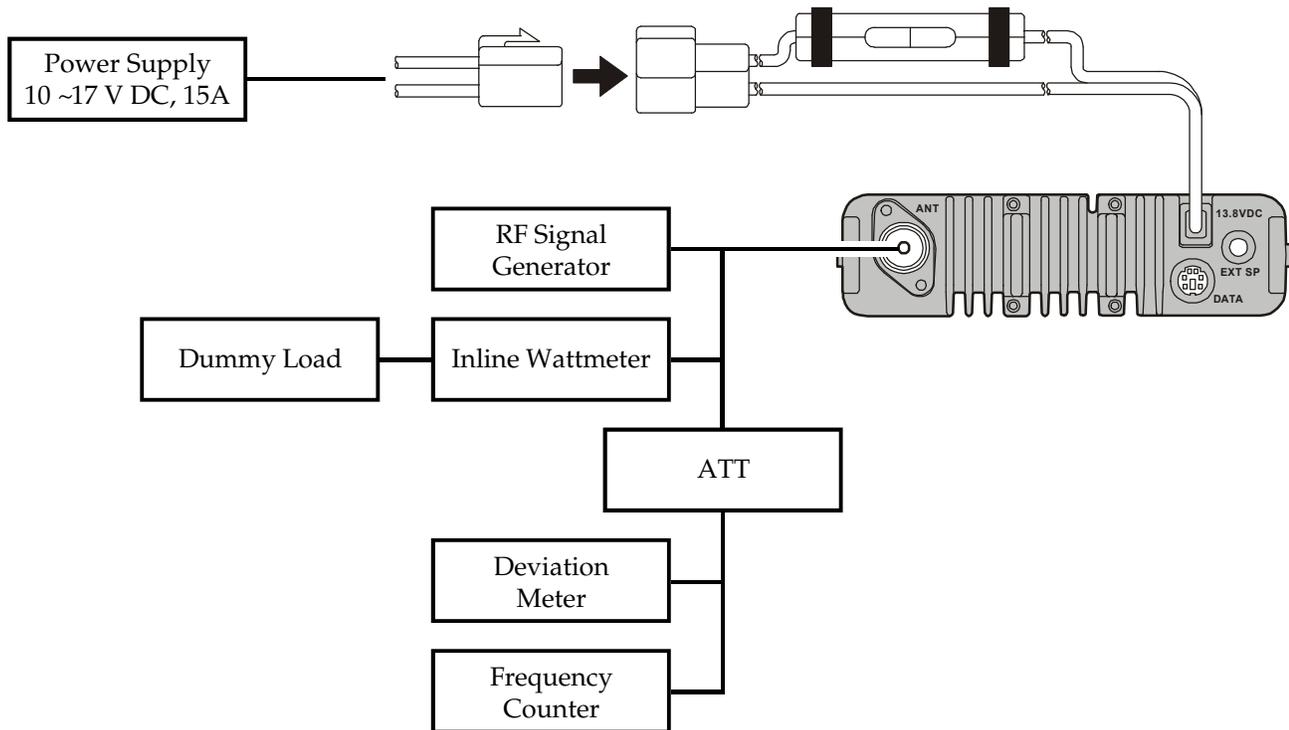

## Alignment Preparation & Precautions

A dummy load and inline wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna. After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature in the repair shop be the same as that of the trans-

ceiver and test equipment, and that this temperature be held constant between 68 °F and 86 °F (20 °C ~ 30 °C). When the transceiver is brought into the shop from hot or cold air it should be allowed some time for thermal equalization with the environment before alignment. If possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

*Note: Signal levels in dB referred to in alignment are based on  $0 \text{ dB}\mu = 0.5 \mu\text{V}$ . (closed circuit).*

## PLL Reference Frequency

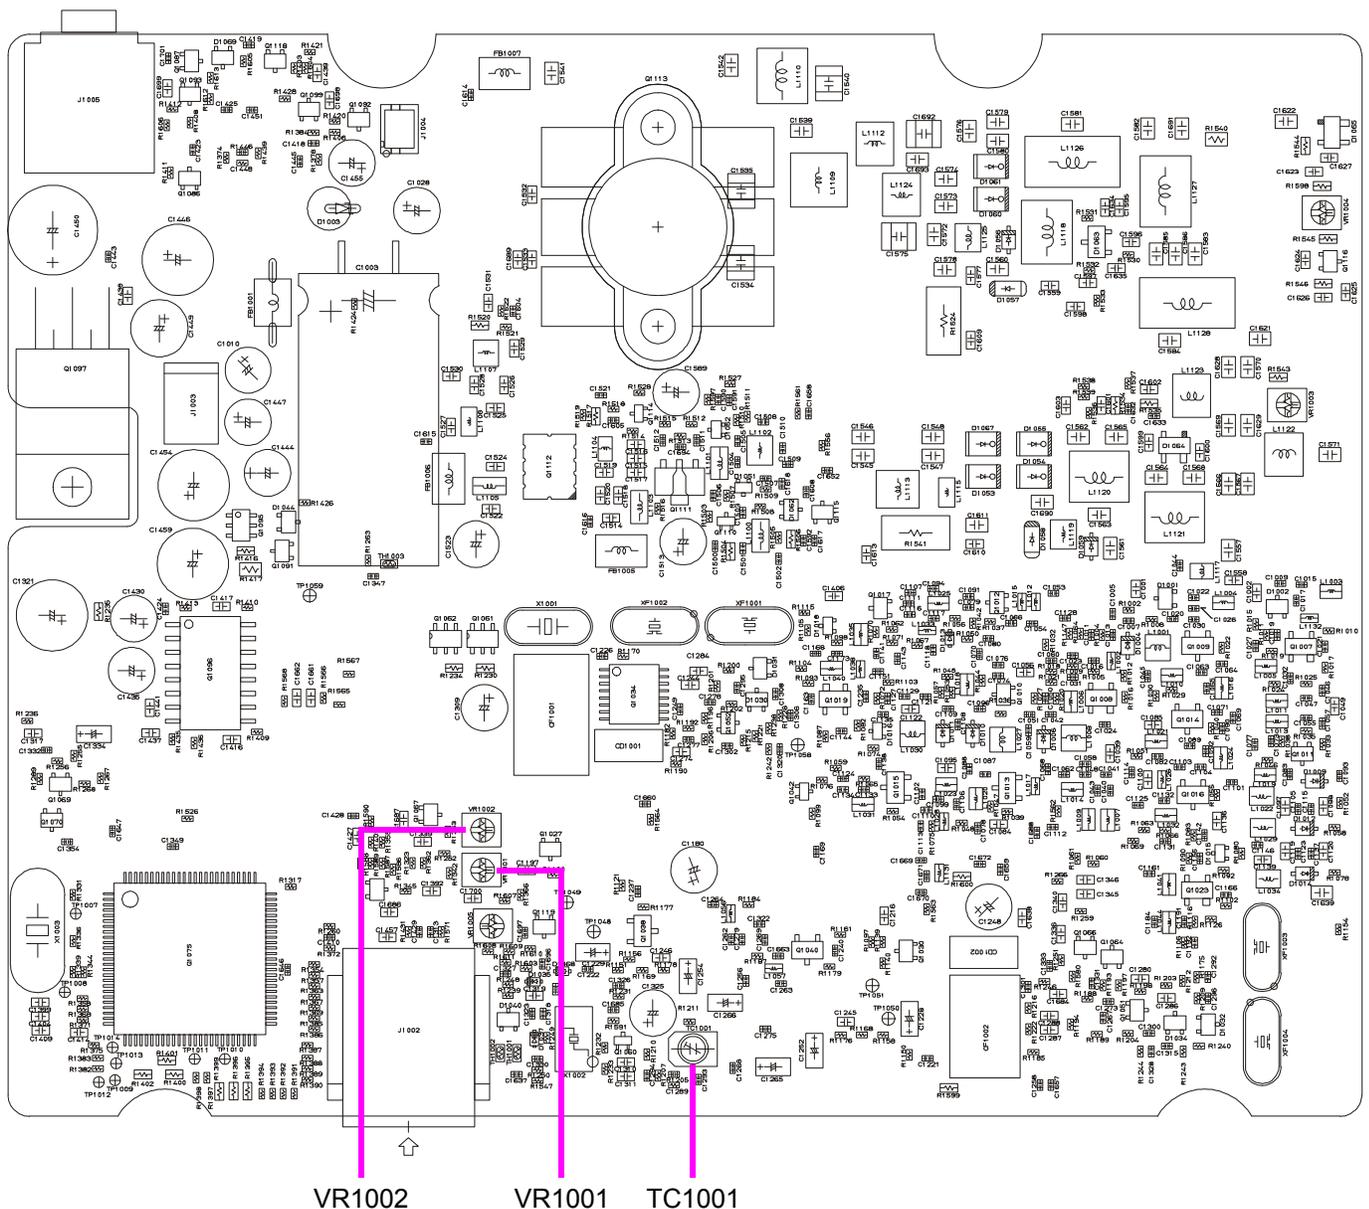

- Connect the wattmeter, dummy load, and frequency counter to the antenna jack.
- Tune the transceiver to 439.900 MHz, and set the TX power level to "MID 2."
- Key the transceiver, and adjust **TC1001** on the MAIN UNIT, if necessary, so the counter frequency is within 100 Hz of 439.900 MHz.

## VHF Transmitter Deviation

- Connect the wattmeter, dummy load, and deviation meter to the antenna jack.
- Inject a 1 kHz audio signal at a level of 50 mV to pin 5 of the **MIC** jack (pin 4 is Ground).
- Key the transmitter on 146.000 MHz. Adjust **VR1002** for  $4.0 \pm 0.5$  kHz (for USA version; other versions:  $4.5 \pm 0.5$  kHz) deviation on the deviation meter.

## UHF Transmitter Deviation

- Leave the wattmeter, dummy load, and deviation meter connected to the antenna jack.
- Inject a 1 kHz audio signal as a level of 50 mV to pin 5 of the **MIC** jack (pin 4 is Ground).
- Key the transmitter on 440.000 MHz. Adjust **VR1001** for  $4.0 \pm 0.5$  kHz (for USA version; other versions:  $4.5 \pm 0.5$  kHz) deviation on the deviation meter.

# Alignment

## Internal System Alignment Routine

This uses a programmed routine in the transceiver which simplifies many complex discrete component settings and adjustments using digitally-controlled settings via the front panel's buttons and LCD indications.

The examples below assume that the transceiver is to be used in a 4-MHz-wide band (144-148 MHz). The factory-default settings for the FT-7100M assume a wider transmit frequency range, so a "trick" must be used to set up the frequencies correctly.

- In the Alignment mode, a special memory table (see below) is temporarily established, providing pre-set frequencies to be used in the alignment process.

CH	VHF	UHF
1	108.000 MHz	360.000 MHz
